## LV5213LP — Bi-CMOS LSI 3ch LED Driver

### Overview

This LV5213LP is LED driver for cell phones. Each LED driver gets a constant current controlled. The brilliance control becomes possible by changing the current value that flows to LED by the serial bus control.

LV5213LP can achieve various effects of the illumination of a full-color LED display.

### Functions

- Three color LED driver circuits.
- The LED current can be switched independently in 5-bit units (0 to 5mA).
- Independent on/off control of the three LED drivers (independent control of the 3 RGB colors).
- Each LED drive current level can be adjusted independently over the serial bus.
- Miniature package.
- Thermal shutdown circuit.

### Specifications

**Absolute Maximum Ratings** at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage 1	V <sub>CC</sub> max		6.0	V
Supply voltage 2	V <sub>DD</sub> max		6.0	V
Allowable power dissipation	P <sub>d</sub> max	Mounted on the specified board *	5.5	W
Maximum input current	V <sub>INB</sub>		6.0	V
Maximum output current	I <sub>O</sub> max		12.0	mA
STBY pin voltage	V <sub>STBY</sub>		6.0	V
Operating temperature	T <sub>opr</sub>		-30 to +75	°C
Storage temperature	T <sub>stg</sub>		-40 to +125	°C

The specified board \*: 50mm × 40mm × 0.8mm glass epoxy (4-layer circuit board).

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

## Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage 1	V <sub>CC</sub>		3.0 to 4.5	V
Supply voltage 2	V <sub>DD</sub>		1.6 to 3.0	V

## Electrical Characteristics

### Operating Characteristics at V<sub>CC</sub> = 3.7V, V<sub>DD</sub> = 1.8V, RT = 82Ω, Ta = 25°C

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Overall Characteristics						
Current drain 1	I <sub>CC1</sub>	STBY = L *1			5	μA
Current drain 2	I <sub>CC2</sub>	STBY = H, RON = GON = BON = L *1 With the default serial data settings		0.6	2	mA
High-level input voltage 1	V <sub>INH1</sub>	Serial data signals, each of the "ON" pins	V <sub>DD</sub> × 0.8			V
Low-level input voltage 1	V <sub>INL1</sub>	Serial data signals, each of the "ON" pins	0		V <sub>DD</sub> × 0.2	V
High-level input voltage 2	V <sub>INH2</sub>	STBY pin	V <sub>DD</sub> × 0.8			V
Low-level input voltage 2	V <sub>INL2</sub>	STBY pin	0		V <sub>DD</sub> × 0.2	V
LED Driver Block						
Minimum output current 1	I <sub>min1</sub>	When the serial data is 00000, V <sub>O</sub> = 0.5V		0.54		mA
Maximum output current 1	I <sub>max1</sub>	When the serial data is 11111, V <sub>O</sub> = 0.5V		4.74		mA
Linearity error	LE	*2	-3		3	LSB
Differential linearity error	DLE	*3	-2		2	LSB
Maximum output current	ΔIL	At the maximum current setting, V <sub>O</sub> = 2 to 0.15V	-10			%
Leakage current	I <sub>leak</sub>	Drivers: off, V <sub>O</sub> = 5V			1	μA

- \*1. The sum of the V<sub>CC</sub> and V<sub>DD</sub> current drain values.
- \*2. Linearity error: The difference between the actual and ideal current values.
- \*3. Differential linearity error: The difference between the actual and ideal amounts when one low-order bit value is added.

## Pin Functions

Pin No.	Pin	Function
1	TEST	Test signal input. This pin must be connected to ground.
2	GND	Ground
3	RT	Reference current setting resistor connection
4	BON	External blue LED control input
5	GON	External green LED control input
6	RON	External red LED control input
7	V <sub>CC</sub>	Circuit system power supply
8	SDATA	Serial data signal input
9	SCLK	Serial clock signal input
10	CS	Chip select
11	STBY2	Standby mode 2 control
12	V <sub>DD</sub>	Control system (RON, GON, BON, SDATA, SCLK, and CS pins) power supply
13	STBY1	Standby mode 1 control
14	RLED	Red LED driver output
15	GLED	Green LED driver output
16	BLED	Blue LED driver output

**Serial Data Transfer Timing Conditions**

Parameter	Symbol	Conditions	min	typ	max	unit
Cycle time	$tcy_1$	SCLK clock period	330			nS
Data setup time	$ts_0$	The CS setup time from the SCLK rising edge	150			nS
	$ts_1$	The SDATA setup time from the SCLK rising edge	100			nS
Data hold time	$th_0$	The CS hold time from the SCLK falling edge	300			nS
	$th_1$	The SDATA hold time from the SCLK rising edge	100			nS
Pulse width	$tw_{1L}$	SCLK low period pulse width	150			nS
	$tw_{1H}$	SCLK high period pulse width	150			nS
	$tw_{2L}$	CS low period pulse width	1.0			$\mu$ S

Data length: 16bits  
 Clock frequency: Up to 2MHz

After 16 clock cycles have been input with CS at the high level, SDATA is acquired on the fall of CS.

Note: SDATA will not be acquired if 15 or fewer clock cycles were input during the CS high-level period. If 17 or more clock cycles are input, the SDATA for the first 16 cycles are acquired and the SDATA following those 16 cycles is ignored.

**Power Supply Application**

1. Either bring up  $V_{CC}$  and  $V_{DD}$  at the same time, or bring up  $V_{CC}$  first then  $V_{DD}$ .
2. Then, set the serial data. (After the serial data has been set, a period of about  $2\mu$ s is required as the startup time for the IC internal circuits.)
3. Finally, clear the STBY pin states.

# LV5213LP

## Pin Descriptions and Equivalent Circuits

Pin No.	Symbol	Equivalent circuit	Description
4 5 6	BON GON RON		Control inputs for the three external colored LEDs When an RSW, GSW, or BSW bit in the serial data is set to 1, the corresponding LED will be on when the voltage applied to the corresponding pin is high, and off when the voltage applied is low.
8 9 10	SDATA SCLK CS		Serial data system inputs
3	RT		Reference current setting resistor connection A reference current is created by connecting an external resistor between this pin and ground. The pin voltage is roughly 1.2V. The LED driver current can be changed by changing this current value.
14 15 16	RLED GLED BLED		Driver outputs for the three color LEDs Feedback is applied to control the current flowing in the output transistors to be the set value. Each of the driver output current levels can be set independently with the serial data.
