Pin Function

Pin No.	Pin name	Description	Equivalent Circuit
1	BOOT	Internal high side nmos fet boot strap capacitor terminal. Connect around 22nF capacitor or greater between SW and BOOT. To operate within absolute maximum rating of SW, to keep stable operation, and to reduce switching noise, please, use a series resistor, Rb (value is around 100Ω) is recommended to use.	
2	V _{IN}	Input Voltage Pin. Large Filter Capacitor (equal or larger than 20μF) should be connected between V _{IN} and GND to eliminate noise on the input and to operate properly.	See BOOT
3	SW	Power Switching Pin. Connect the output LC filter. Connect the above-mentioned capacitor between this pin and BOOT pin.	See BOOT
4	GND	Ground pin.	
5	FB	Feedback pin. Connect a voltage divider resistor across FB to set the regulated output voltage. The output voltage is given by next equation. $V_{OUT} = V_{ref} \times \left\{ 1 + \frac{(R1 + R10)}{R3} \right\}$ V _{ref} = 0.8V Example: 3.3V output voltage (See Block Diagram and Sample Application Circuit) $V_{OUT} = 0.8 \times \left\{ 1 + \frac{(27k + 4.3k)}{10k} \right\}$ =3.304V	
6	COMP	Phase compensation pin. Connect an external capacitor and a resistor for the DC DC converter close loop-phase compensation.	
7	EN	Enable terminal. If applying logically high voltage, or left open, the converter operates. If connected to GND, the converter's operation stops.

8	SS	<p>Soft start terminal</p> <p>Internal source current (10μA) and external capacitor will make soft start time.</p> <p>Soft start capacitor, C6 is given by next equation,</p> $C6 = 10\mu A \times \frac{T_{ss}}{V_{ref}}$ <p>Where, Tss : soft start time, Vref : reference voltage</p> <p>Example : soft start time = 1.2ms</p> $C6 = 10\mu A \times \frac{1.2ms}{0.8V} = 0.015\mu F$	See FB

Considerations for the design

- Insertion of serial beads in the Schottky diode for removal of noise may cause generation of the negative voltage on SW pin deviating from the absolute maximum rating at the SW pin, resulting in failure of normal operation. Please, do not insert beads as above described. Instead, remove noise by Rb resistor.
- Exposed pad on the bottom side of the IC should be soldered. We cannot recommend other usages of the exposed pad.
