DATA SHEET

LV8212T — Bi-CMOS IC For CD and DVD-ROM System Motor Driver

Overview

The LV8212T is a system motor driver IC that implements all the motor driver circuits required by CD and DVD players in just a single IC. Since the LV8212T includes both a spindle motor driver and sled, tilt, focus and tracking drivers (as two-phase stepper method), it can contribute to thinner form factors and miniaturization in end products.

Furthermore, the spindle motor driver uses a direct PWM sensor-less drive method that minimizes the number of external components and provides highly efficient motor drive.

Function

- PWM H-bridge motor driver (5channels) + direct PWM sensor-less motor driver

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply Voltage	V _{CC} max		6	V
Output block supply voltage	V _S max		6	V
Predriver voltage (gate voltage)	V _G max		10	V
Spindle output current	I _O max1		1.3	A
Channel 1 and 2 output current	I _O max2		0.8	A
Channel 3 output current	I _O max3		0.6	A
Channel 4 and 5 output current	I _O max4		0.8	A
Allowable power dissipation	P _d max	Independent IC	0.45	W
Operating temperature	T _{opr}		-30 to +85	°C
Storage temperature	T _{stg}		-55 to +150	°C

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Pin Descriptions

Pin No.	Pin name	Description
1, 6, 8	SPGND	Spindle output current detection pin. The drive current is detected by connecting low resistance to GND.
2	UOUT	3-phase spindle U-phase output pin. Motor coil is connected to this pin.
3	VOUT	3-phase spindle V-phase output pin. Motor coil is connected to this pin.
4	WOUT	3-phase spindle W-phase output pin. Motor coil is connected to this pin.
5	SPRF	Detection signal input pin of spindle output current. This pin must be used shorted to the SPGND pin.
7, 9	NC	
10, 63	SPVS	Power supply pin for spindle driver. Connect a capacitor between this pin and GND.
11	ISH	
12	ISL	
13	SPCOM	Spindle motor COM point connection.
14	SPCIN	Spindle motor position detection comparator filter pin. Connect a capacitor between this pin and SPFIL pin (pin 15).
15	SPFIL	Spindle motor position detection comparator filter pin. Connect a capacitor between this pin and SPCIN pin (pin 14).
16	VCCTL	Spindle speed control pin. Positive torque control is applied when greater than VCCREF.
17	OSC	Motor start-up oscillation frequency alternative pin. If this pin is connected to GND or the V _{CC} pin, start-up oscillation select the internal oscillation dividing signal. When a capacitor connect between this pin and GND pin, the start-up frequency is adjusted by charge and discharge current (2.5μA) and capacitance of capacity.
18, 19	SGND	Small signal GND pin.
20	SREF	Spindle control reference voltage input pin.
21	AREF	Control reference voltage input pin of channel 4 and 5 actuator.
22	IN5	Speed control pin of the channel 5 actuator.
23	IN4	Speed control pin of the channel 4 actuator.
24	CF3	Current feedback circuit output pin of the channel 3 actuator (H-bridge).
25	IN3	Control signal input pin of the channel 3 actuator (H-bridge).
26	CF2	Current feedback circuit output pin of the channel 2 actuator (H-bridge).
27	IN2	Control signal input pin of the channel 2 actuator (H-bridge).
28	CF1	Current feedback circuit output pin of the channel 1 actuator (H-bridge).
29	IN1	Control signal input pin of the channel 1 actuator (H-bridge).
30	VS4	Power supply pin for the channel 4 and 5 of the actuator. Connect a capacitor between this pin and GND.
31	GND	Ground
32	RF5	Output current detection signal input of the channel 5 actuator. This pin must be used shorted to the PGND5 pin. (pin 33)
33	PGND5	Output current detection pin of the channel 5 actuator. The drive current is detected by connecting low resistance to GND
34	OUT5F	H-bridge output of the channel 5 actuator.
35	OUT5R	
36	OUT4F	H-bridge output of the channel 4 actuator.
37	OUT4R	
38	RF4	Output current detection signal input pin of the channel 4 actuator. This pin must be used shorted to the PGND4 pin (pin 39).
39	PGND4	Output current detection pin of the channel 4 actuator. The drive current is detected by connecting low resistance to GND
40	OUT3R	Output pin of the channel 3 actuator.
41	PGND3	GND pin of the output block of the channel 3 actuator.
42	VS3	Power supply pin for drive of the channel 3 actuator. Connect a capacitor between this and GND.
43	OUT3F	Channel 3 actuator output pin
44	OUT2R	Channel 2 actuator output pin.
45	OUT2F	
46	OUT1R	Channel 1 actuator output pin.
47	OUT1F

Pin No.	Pin name	Description
48	PGND1	GND pin of the output block of the channel 1, 2 actuator.
49	VS1	Power supply pin for drive of the channel 1 and 2 actuator. Connect a capacitor between this and GND.
50, 51	GND	Small signal GND pin. Sled driver block position detection comparator output pin.
52	MUTE	MUTE pin except for channels 4 and 5. The output pin, except for channels 4 and 5, must be left open.
53	S/S	Spindle motor block start/stop control. Apply a high level for the start state.
54	GSW	Spindle motor V type control GAIN switching pin.
55	BRK	Spindle motor block braking type switching control. Low level : reverse torque braking.
56	CPC	Used for charge pump voltage step up. Connect a capacitor between this and the CP pin (pin.57).
57	CP	Charge pump voltage step up pulse output. Connect a capacitor between this pin and CPC pin (pin.56)
58	VG	Charge pump voltage step up output. Connect a capacitor between this pin and GND.
59, 60	V _{CC}	Small signal system power supply pin. Connect a capacitor between this pin and GND.
61	FG1	FG pulse output pin (MOS open drain output). Outputs a pulse signal equivalent to a one Hall sensor system pulse out put.
62	FG3	FG pulse output pin (MOS open drain output). Outputs a pulse signal equivalent to a three Hall sensor system pulse out put.
64	GND	Small signal GND pin.

Pin Functions

62	FG3	FG pulse output pin (MOS open drain output). Outputs a pulse signal equivalent to a three Hall sensor system pulse out put.	

LV8212T Functional Description and External Components

This document presents information necessary to design systems with the best possible characteristics and should be read before designing driver circuits using the LV8212T.

1. Output Drive Circuits and Speed Control Methods

The LV8212T adopts a synchronous commutation direct PWM drive method to minimize power loss in the output. Low on-resistance DMOS devices are used as the output transistors. (the upper and lower side output block devices on-resistance is 0.5Ω (typical)).

The LV8212T spindle drivers control system takes an analog input and uses a V-type control amplifier.

The gain of V-type control circuit can be selected by the following formula with the GSW pin (pin 54).

$$\text{typ} = 0.34\text{V/V (when the GSW pin is low)}$$

$$\text{and typ} = 0.17\text{V/V (when the GSW pin is high).}$$

The V-type control amplifier based speed control system controls the speed by controlling the voltage of the VCTL pin (pin 16) and SREF pin (pin 20). The circuit provides forward torque when VCTL is greater than VCREF, and allows the application to select either reverse torque braking (when the BRK pin is low) or short-circuit braking (when the BRK pin is low) when VCTL is less than VCREF. The PWM frequency is twice the frequency of the charge pump pulse rate (pin 57).

2. Soft Switching Circuit

This IC performs “soft switching”, which is a technique that varies the duty and achieves quieter motor operation by reducing the level of motor drive noise. This IC provides a “current application ON/OFF dual sided soft switching” type soft switching function.

3. Current Limiter Circuit

The current limit value of the current limiter circuit is determined by RF in the equation $I = V_{RF}/R_f$ (here, $V_{RF} = 0.20\text{V}$, typical).

Spindle block : the current limiter circuit detects the SPGND pin (pin 1, 6 and 8) peak current at the SPRF pin (pin 5) and turns the sink side transistor off.

4. OSC circuit

The OSC pin (pin 17) is an oscillation terminal for start-up current commutation of sensor-less, it has two types, the main-clock dividing mode, and the self-excited oscillation mode. The main-clock dividing mode can be set-up by connecting the OSC pin to the VCC pin or GND. The set-up frequency is divided by internal oscillation frequency (here, 3.2 MHz as typical). And, when the OSC pin is connected to the VCC pin (high level), the main-clock divided by 4096 to get ground 781Hz.

Also, when the OSC pin is connected to GND, the main-clock is divided by 3072 to get around 1042Hz.

The self-excited oscillation mode can be set up by connecting a capacitor between the OSC pin and GND.

When the self-excited oscillation mode is chosen, the OSC pin starts self-excited.

Thus, it becomes set-up frequency. Oscillation frequency can be adjusted by changing the capacity of an external capacitor. (ex, if capacity is made small, the set-up frequency will become high.)

When the OSC pin is connected to the VCC pin or GND, and if there is no problem in the start-up characteristic, the number of external components are reduced. However, if a problem occurs in it, you should choose the value of a capacitor which can obtain the best start-up characteristic after choosing self-excited mode.

5. Spindle Block Position Sensor comparator Circuit

The spindle block position sensor comparator circuit uses the back EMF signal generated by motor rotation to detect the rotor position. The output block power application timing is determined based on the position information acquired by this circuit. Start-up problems due to noise on the comparator inputs can be ameliorated by inserting a capacitor (1000 of 4700pF) between the SPCIN pin (pin 14) and the SPFIL pin (pin 15).

6. Actuator Block (channel 4 and 5) Output Drive Circuit and Speed Control Method

This IC adopts a synchronous commutation direct PWM drive method. Low on-resistance DMOS devices are used as the output transistors. (the upper and lower side output block devices on-resistance is 1.3Ω (typical)).

This circuit takes an analog input and uses a V-type control amplifier. The V-type control amplifier based speed control system controls the speed by controlling the voltage of the IN4 pin (pin 23 : channel 4), the IN5 pin (pin 22 : channel 5) and the AREF pin (pin 21).

7. Actuator Block (channel 4 and 5) Current Limiter Circuit

Actuator block : the current limiter circuit detects the PGND4 pin (pin 39 : channel 4) and the PGND5 pin (pin 33 : channel 5) peak current at the RF4 pin (pin 38 : channel 4) and the RF5 pin (pin 32 : channel 5) and turns the SINK side transistor off.

8. S/S and MUTE Circuit

The S/S pin (pin 53) functions as the spindle motor driver's and the actuators motor driver's start/stop pin ; a high-level input specifies that the operation is in the start state.

The MUTE pin (pin 52) operates in all the driver blocks except for channels 4 and 5 ; a high-level input mutes these outputs.

In the muted state, the H-bridge drivers will shift to high-impedance state, regardless of the logic input conditions for the spindle motor driver, if mute is activated while the motor is active, the motor will slow down as set by the BRK pin (High means a short brake, Low means a reverse torque brake). After the motor stops, all the outputs will become high (short brake condition).

A low level input must be applied to the S/S pin to set the IC to the standby state (power saving mode).

9. BRK Circuit

The BRK pin (pin 55) switches between reverse torque and short-circuit braking ; a high level selects short-circuit braking and a low level selects reverse torque braking. When the motor speed becomes adequately slow in the reverse torque braking state, the application must switch to the short-circuit braking state to stop the motor (Note : The IC must not be in the power saving state at this point.).

Set the S/S pin (pin 53) to the low level to put the IC in power saving state.

10. FG Output Circuit

The FG3 pin (pin 62) is the spindle block FG output pin. It provides a pulse signal equivalent to that provided by systems that use three Hall-effect sensors. The FG1 pin (pin 61) outputs a signal that follows the spindle output U phase back EMF voltage. The FG1 and the FG3 pins both have a MOS open-drain output circuit structure.

This means that external pull-up resistors must be provided. Connect the power supply from the FG signal input side as the pull-up resistor power supply. We recommended using a resistor of about 10k Ω .

11. Charge Pump Circuit

Since the LV8212T has a DMOS (n-channel) output structure, it includes a charge pump based voltage step-up circuit. When capacitors (recommended value : 0.22 μ F of higher) are connected between the CP and CPC pins, the IC generates a level that is twice the V_{CC} voltage (or 9.5V). It is desirable that this IC be used with the voltage relation ship between the stepped-up voltage (VG) and the motor supply voltage (VS) meeting the condition $VG-VS \geq 3.5V$. Note that the stepped-up voltage (VG) is, by design, clamped at about 9.5V DC. If the stepped-up voltage (VG) exceeds 10V (VG max) due to ripple, the value of the VG pin capacitor must be increased.

Observe the following points if the VG voltage is supplied externally.

(1) The externally applied VG voltage must not exceed VGmax in the Absolute Maximum Ratings.

(2) The capacitor between the CP and the CPC pin (pin 57 and 56) is not required.

(3) The sequence in which the VG voltage is applied requires care. The VG voltage must be applied after V_{CC} , and must be removed before V_{CC} is cut.

(4) Since there is an internal diode between the V_{CC} and VG pins in the IC, a voltage such that $V_{CC} > VG$ must never be applied to the VG pin.

(1) Ground and V_{CC}/V_S lines.

Small-signal system ground pins → SGND (pin 18 and 19).

Large-signal system ground pins → PGND1 (pin 48), PGND3 (pin 41) and GND (pin 31 and 64).

Small-signal system power supply pins $\rightarrow V_{CC}$ (pin 59 and 60).

Large-signal system power supply pins → SPVS (pin 10 and 63), VS1 (pin 49), VS3 (pin 42) and VS4(pin 38).

Capacitors must be connected between the small-signal system power supply pin and GND. Locate these capacitors as close to the IC as possible.

The large-signal system GND (PGND) pins must be connected with the shortest distances possible, and furthermore must not have any shared impedances with the small-signal system ground lines.

The large signal system power supply (VS) pins must also be connected with the shortest distances possible, and capacitors must be connected between these pins and the corresponding large-signal system ground pin. Locate these capacitors as close to the IC as possible.

(2) Location of small-signal system external components.

Of the small-signal system external components, those that are connected to ground must be connected to the small-signal system ground with the shortest possible lines.

Application Circuit Example

Remarks : Connect a capacitor the terminals SPVS and GND, the terminals V_{CC} and GND, the terminals VS1 and GND, the terminals VS3 and GND and the terminals VS4 and GND.

* When the motor start up oscillation frequency is adjusted, a capacitor is connected at the outer side of the OSC pin.

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor Co.,Ltd. products described or contained herein are controlled under any of applicable local export control laws and regulations, such products may require the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written consent of SANYO Semiconductor Co.,Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO Semiconductor Co.,Ltd. product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only; it is not guaranteed for volume production.
- Upon using the technical information or products described herein, neither warranty nor license shall be granted with regard to intellectual property rights or any other rights of SANYO Semiconductor Co.,Ltd. or any third party. SANYO Semiconductor Co.,Ltd. shall not be liable for any claim or suits with regard to a third party's intellectual property rights which has resulted from the use of the technical information and products mentioned above.
