3.2 BACKLIGHT UNIT

$T_a = 25 \pm 2\text{ }^\circ\text{C}$

Parameter	Symbol	Value			Unit	Note
		Min.	Typ.	Max.		
Lamp Input Voltage	V_L	605	675	745	V_{RMS}	$I_L = (6.5)\text{ mA}$
Lamp Current	I_L	6	12	13	mA_{RMS}	(1)

Operating Frequency	F_L	45	50	80	KHz	(3)
Lamp Life Time	L_{BL}	40,000	50,000	-	Hrs	(5)
Power Consumption	P_L	-	16.2	-	W	(4), $I_L = (6.5)\text{ mA}$

Note (1) Lamp current is measured by utilizing high frequency current meters as shown below:

Note (2) The voltage shown above should be applied to the lamp for more than 1 second after startup. Otherwise the lamp may not be turned on.

Note (3) The lamp frequency may produce interference with horizontal synchronous frequency from the display, and this may cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.

Note (4) $P_L = I_L \times V_L$

Note (5) The lifetime of lamp can be defined as the time in which it continues to operate under the condition $T_a = 25 \pm 2 \text{ }^\circ\text{C}$ and $I_L = (2.0) \sim (6.5) \text{ mA}$ until one of the following events occurs:

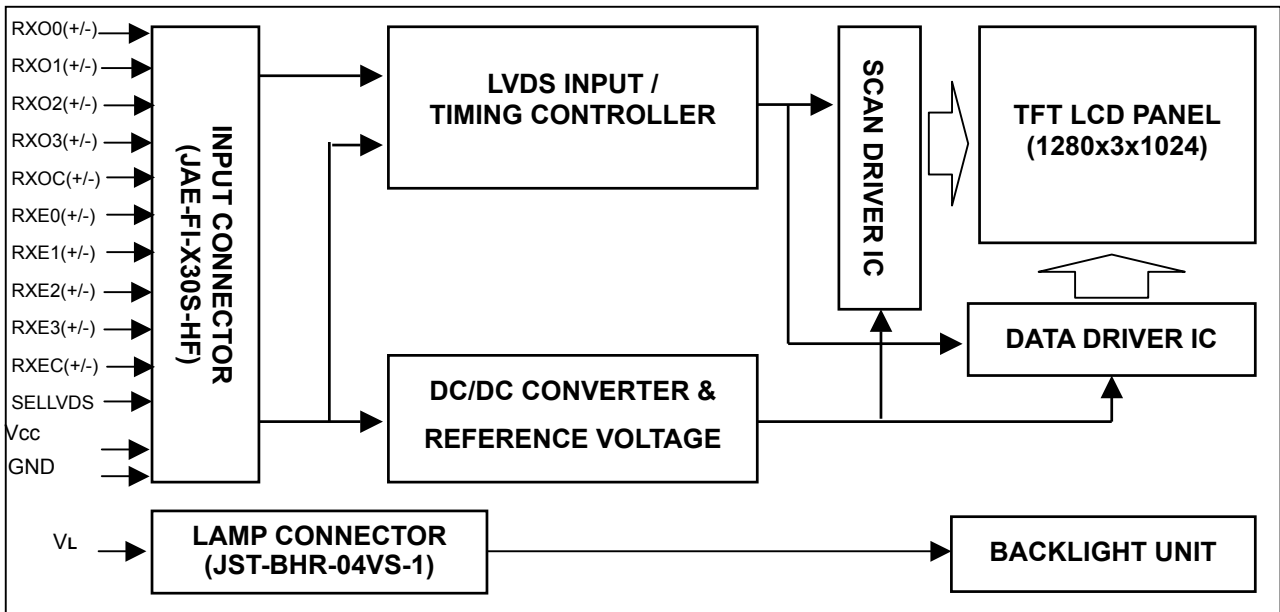

(a) When the brightness becomes or lower than 50% of its original value.

(b) When the effective ignition length becomes or lower than 80% of its original value. (Effective ignition length is defined as an area that has less than 70% brightness compared to the brightness in the center point.)

Note (6) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid producing too much current leakage from high voltage output of the inverter. When designing or ordering the inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

Note (1) Because this module is operated by DE only mode, Hsync and Vsync input signals should be set to low logic level or ground. Otherwise, this module would operate abnormally.

Note (2) The relationship of Fc and Th must satisfy formula $(Th-216)/Fc > 9.3$.

INPUT SIGNAL TIMING DIAGRAM

6.2 POWER ON/OFF SEQUENCE

To prevent a latch-up or DC operation of LCD module, the power on/off sequence should be as the diagram below.

Note.

- (1) The supply voltage of the external system for the module input should be the same as the definition of V_{CC}.
- (2) Apply the lamp voltage within the LCD operation range. When the backlight turns on before the LCD operation of the LCD turns off before the backlight turns off, the display may momentarily become abnormal screen.
- (3) In case of v_{CC} = off level, please keep the level of input signals on the low or keep a high impedance.
- (4) T₄ should be measured after the module has been fully discharged between power of and on period.
- (5) Interface signal shall not be kept at high impedance when the power is on.

Note (1) Definition of Viewing Angle (θ_x, θ_y):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{255} / L_0$$

L255: Luminance of gray level 255

L 0: Luminance of gray level 0

$$\text{CR} = \text{CR} (5)$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (7).

Note (3) Definition of Response Time (T_R, T_F):

Note (4) Definition of Luminance of White (L_C):

Measure the luminance of gray level 255 at center point

$$L_C = L(5)$$

$L(x)$ is corresponding to the luminance of the point X at Figure in Note (7).

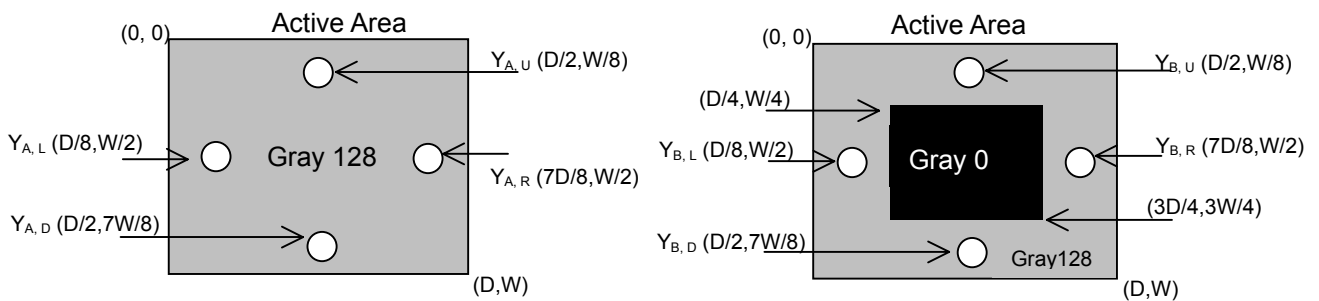

Note (5) Definition of Cross Talk (CT):

$$CT = |Y_B - Y_A| / Y_A \times 100 (\%)$$

Where:

Y_A = Luminance of measured location without gray level 0 pattern (cd/m^2)

Y_B = Luminance of measured location with gray level 0 pattern (cd/m^2)

Note (6) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

Note (7) Definition of White Variation (δW):

Measure the luminance of gray level 255 at 5 points

$$\delta W = \text{Maximum [L (1), L (2), L (3), L (4), L (5)] / Minimum [L (1), L (2), L (3), L (4), L (5)]}$$

Note (8) Grayscale Inversion Angle

Measure the luminance of each of nine grayscale from black to white at screen center in vertical and horizontal view directions. The inversion angle $\theta(L_N=L_{N+1})$ corresponds to $L_N=L_{N+1}$ for each adjacent gray level pair. ($N=0$ to 8 , correspond to grayscale = $0, 32, 64, 96, 128, 160, 192, 224, 255$) The smallest angles of which an inversion occurs between any adjacent gray-level pair for each direction, up, down, left, and right, are defined as

$$\theta_{x+}^{inv} = \text{Min} [\theta_{x+} (L_N, L_{N+1})], \quad N=0\sim 8$$

$$\theta_{x-}^{inv} = \text{Min} [\theta_{x-} (L_N, L_{N+1})], \quad N=0\sim 8$$

$$\theta_{y+}^{inv} = \text{Min} [\theta_{y+} (L_N, L_{N+1})], \quad N=0\sim 8$$

$$\theta_{y-}^{inv} = \text{Min} [\theta_{y-} (L_N, L_{N+1})], \quad N=0\sim 8$$

Note (9) Definition of TCO 99 Luminance Uniformity (Angular-dependent) (LR):

Luminance is measured at the center measurement position “C” on the LCD panel. The optical axis of the luminance meter shall be aligned with the normal of the panel surface. The measuring distance between the photometer and the surface of the panel is defined as:

$$Md \text{ (cm)} = \text{diagonal of the panel (cm)} \times 1.5 \quad \text{with minimum distance 50 cm.}$$

The panel is rotated around a vertical axis which passes the center of the display by changing the azimuthal angle to +30°. The distance between the panel and the photometer remains unchanged and the measured point is exact the same as the previous measured point.

The photometer is then rotated by changing its azimuthal angle with the fixed distance to the panel. Luminance at points “L” and “R” are given:

The LCD panel is then rotated to another azimuthal angle to -30°; and $L_{\min, -30^\circ}$ and $L_{\max, -30^\circ}$ are obtained by using the same procedure.

The Luminance Uniformity (LR) is calculated as follow:

$$LR = ((L_{\max, +30^\circ} / L_{\min, +30^\circ}) + (L_{\max, -30^\circ} / L_{\min, -30^\circ})) / 2.$$

Note (10) Definition of TCO 99 Luminance Contrast (Angular-dependent) (Cm):

Luminance contrast is measured at the center point of the LCD panel "C" along with the normal of the display with the same distance described in Note 13. The display is then rotated around the vertical axis by changing its azimuthal axis to +30°; and this gives:

$L_{255 \text{ G.L., } +30^\circ}$ and $L_{0 \text{ G.L., } +30^\circ}$.

The LCD panel is then rotated to azimuthal angle to -30°; and $L_{0 \text{ G.L., } -30^\circ}$ and $L_{63 \text{ G.L., } -30^\circ}$ are obtained by using the same procedure. The Luminance Contrast (Cm) is calculated:

$$C_m = (L_{255 \text{ G.L.}} - L_{0 \text{ G.L.}}) / (L_{255 \text{ G.L.}} + L_{0 \text{ G.L.}})$$

For both +30° and -30°. The lower value for Cm is reported.

10. PRECAUTIONS

10.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- (4) Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- (5) Do not pull the I/F connector in or out while the module is operating.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- (9) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (10) When ambient temperature is lower than 10°C may reduce the display quality. For example, the response time will become slowly, and the starting voltage of CCFL will be higher than room temperature.

10.2 SAFETY PRECAUTIONS

- (1) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with inverter. Do not disassemble the module or insert anything into the Backlight unit.
- (2) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (3) After the module's end of life, it is not harmful in case of normal operation and storage.
