

64 Kbit (8Kb x8) Parallel EEPROM

- FAST ACCESS TIME: 150ns
- SINGLE 5V ± 10% SUPPLY VOLTAGE
- LOW POWER CONSUMPTION
- FAST WRITE CYCLE
 - 32 Bytes Page Write Operation
 - Byte or Page Write Cycle: 5ms
- ENHANCED END OF WRITE DETECTION
 - Ready/Busy Open Drain Output (for M28C64C product only)
 - Data Polling
 - Toggle Bit
- PAGE LOAD TIMER STATUS BIT
- HIGH RELIABILITY SINGLE POLYSILICON, CMOS TECHNOLOGY
 - Endurance >100,000 Erase/Write Cycles
 - Data Retention >40 Years
- JEDEC APPROVED BYTEWIDE PIN OUT

DESCRIPTION

The M28C64C is an 8 Kbit x8 low power Parallel EEPROM fabricated with STMicroelectronics proprietary single polysilicon CMOS technology. The device offers fast access time with low power dissipation and requires a 5V power supply.

The circuit has been designed to offer a flexible microcontroller interface featuring both hardware and software handshaking mode with Ready/Busy, Data Polling and Toggle Bit. The M28C64C supports 32 byte page write operation.

Table 1. Signal Names

A0 - A12	Address Input
DQ0 - DQ7	Data Input / Output
\overline{W}	Write Enable
\overline{E}	Chip Enable
\overline{G}	Output Enable
\overline{RB}	Ready / Busy
V _{CC}	Supply Voltage
V _{SS}	Ground

PIN DESCRIPTION

Addresses (A0-A12). The address inputs select an 8-bit memory location during a read or write operation.

Chip Enable (E). The chip enable input must be low to enable all read/write operations. When Chip Enable is high, power consumption is reduced.

Output Enable (G). The Output Enable input controls the data output buffers and is used to initiate read operations.

Table 2. Absolute Maximum Ratings

Symbol	Parameter	Value	Unit
T_A	Ambient Operating Temperature	- 40 to 125	°C
T_{STG}	Storage Temperature Range	- 65 to 150	°C
V_{CC}	Supply Voltage	- 0.3 to 6.5	V
V_{IO}	Input/Output Voltage	- 0.3 to $V_{CC} + 0.6$	V
V_I	Input Voltage	- 0.3 to 6.5	V
V_{ESD}	Electrostatic Discharge Voltage (Human Body model)	2000	V

Note: Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

Table 3. Operating Modes

Mode	\bar{E}	\bar{G}	\bar{W}	DQ0 - DQ7
Read	V_{IL}	V_{IL}	V_{IH}	Data Out
Write	V_{IL}	V_{IH}	V_{IL}	Data In
Standby / Write Inhibit	V_{IH}	X	X	Hi-Z
Write Inhibit	X	X	V_{IH}	Data Out or Hi-Z
Write Inhibit	X	V_{IL}	X	Data Out or Hi-Z
Output Disable	X	V_{IH}	X	Hi-Z

Note: X = V_{IH} or V_{IL}

Data In/Out (DQ0 - DQ7). Data is written to or read from the M28C64C through the I/O pins.

Write Enable (\bar{W}). The Write Enable input controls the writing of data to the M28C64C.

Ready/Busy (RB). Ready/Busy is an open drain output that can be used to detect the end of the internal write cycle.

OPERATION

In order to prevent data corruption and inadvertent write operations during power-up, a Power On Reset (POR) circuit resets all internal programming circuitry. Access to the memory in write mode is allowed after a power-up as specified in Table 6.

Read

The M28C64C is accessed like a static RAM. When \bar{E} and \bar{G} are low with \bar{W} high, the data addressed is presented on the I/O pins. The I/O pins are high impedance when either \bar{G} or \bar{E} is high.

Write

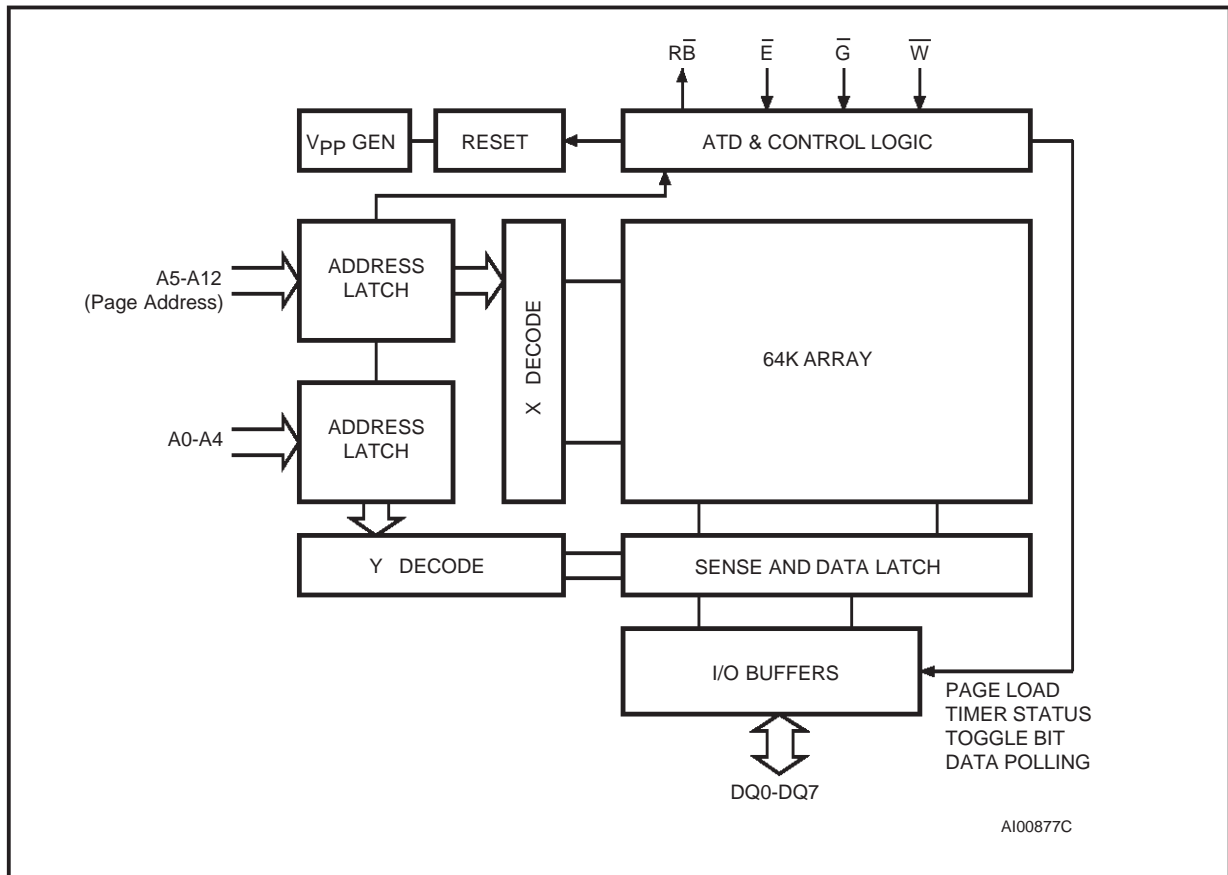

Write operations are initiated when both \bar{W} and \bar{E} are low and \bar{G} is high. The M28C64C supports both \bar{E} and \bar{W} controlled write cycles. The Address is latched by the falling edge of \bar{E} or \bar{W} which ever occurs last and the Data on the rising edge of \bar{E} or \bar{W} which ever occurs first. Once initiated the write operation is internally timed until completion.

Page Write

Page write allows up to 32 bytes to be consecutively latched into the memory prior to initiating a programming cycle. All bytes must be located in a single page address, that is A5 - A12 must be the same for all bytes. The page write can be initiated during any byte write operation.

Following the first byte write instruction the host may send another address and data up to a maximum of 100 μ s after the rising edge of \bar{E} or \bar{W} which ever occurs first (t_{BLC}). If a transition of \bar{E} or \bar{W} is not detected within 100 μ s, the internal programming cycle will start.

Figure 3. Block Diagram

Microcontroller Control Interface

The M28C64C provides two write operation status bits and one status pin that can be used to minimize the system write cycle. These signals are available on the I/O port bits DQ7 or DQ6 of the memory during programming cycle only, or as the \overline{RB} signal on a separate pin.

Figure 4. Status Bit Assignment

DQ7	DQ6	DQ5	DQ4	DQ3	DQ2	DQ1	DQ0
DP	TB	PLTS	Hi-Z	Hi-Z	Hi-Z	Hi-Z	Hi-Z

DP = Data Polling
 TB = Toggle Bit
 PLTS = Page Load Timer Status

Data Polling bit (DQ7). During the internal write cycle, any attempt to read the last byte written will produce on DQ7 the complementary value of the previously latched bit. Once the write cycle is finished the true logic value appears on DQ7 in the read cycle.

Toggle bit (DQ6). The M28C64C offers another way for determining when the internal write cycle is completed. During the internal Erase/Write cycle, DQ6 will toggle from "0" to "1" and "1" to "0" (the first read value is "0") on subsequent attempts to read any address in the memory. When the internal cycle is completed the toggling will stop and the device will be accessible for a new Read or Write operation.

Page Load Timer Status bit (DQ5). In the Page Write mode data may be latched by \overline{E} or \overline{W} up to 100 μ s after the previous byte. Up to 32 bytes may be input. The Data output (DQ5) indicates the status of the internal Page Load Timer. DQ5 may be read by asserting Output Enable Low (t_{PLTS}). DQ5 Low indicates the timer is running, High indicates time-out after which the write cycle will start and no new data may be input.

Ready/Busy pin. The \overline{RB} pin provides a signal at its open drain output which is low during the erase/write cycle, but which is released at the completion of the programming cycle.

Table 4. AC Measurement Conditions

Input Rise and Fall Times	≤ 20ns
Input Pulse Voltages	0.4V to 2.4V
Input and Output Timing Ref. Voltages	0.8V to 2.0V

Note that Output Hi-Z is defined as the point where data is no longer driven.
