

To all our customers

Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.)

Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note : Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

Description

Description

The M30221 group of single-chip microcomputers are built using the high-performance silicon gate CMOS process using a M16C/60 Series CPU core. The M30221 group has LCD controller/driver. M30221 group is packaged in a 120-pin plastic molded QFP. These single-chip microcomputers operate using sophisticated instructions featuring a high level of instruction efficiency. With 1M bytes of address space, they are capable of executing instructions at high speed.

Features

- Basic machine instructions Compatible with the M16C/60 series
- Memory capacity See Figure 1.1.3 Memory Expansion
- Shortest instruction execution time 100ns (f(XIN)=10MHz)
- Supply voltage 4.0 to 5.5V (f(XIN)=10MHz)
2.7 to 5.5V (f(XIN)=7MHz with software one-wait)
- Interrupts 24 internal and 8 external interrupt sources, 4 software interrupt sources; 7 levels(including key input interrupt)
- Multifunction 16-bit timer Timer A (output) x 8, timer B (input) x 6
- Real time port outputs 8 bits X 3 lines, 6 bits X 1 lines
- Serial I/O 2 channels for UART or clock synchronous
- DMAC 2 channels (trigger: 24 sources)
- A-D converter 10 bits X 7 channels
- D-A converter 8 bits X 2 channels
- Watchdog timer 1 line
- Programmable I/O 83 lines (26 lines are shared with LCD outputs)
- Output port 14 lines (14 lines are shared with LCD output)
- Input port 1 line (P77, shared with NMI pin)
- LCD drive control circuit 1/2, 1/3 bias
2, 3 and 4 duty
4 common outputs
40 segment outputs
built-in charge pump
- Key input interrupt 20 lines
- Clock generating circuit 2 built-in clock generation circuits
(built-in feedback resistor, and external ceramic or quartz oscillator)

Specifications written in this manual are believed to be accurate, but are not guaranteed to be entirely free of error. Specifications in this manual may be changed for functional or performance improvements. Please make sure your manual is the latest edition.

Applications

Camera, Home appliances, Portable equipment, Audio, office equipment, etc.

Description

Performance Outline

Table 1.1.1 is performance outline of M30221 group.

Table 1.1.1. Performance outline of M30221 group

Item		Performance	
Number of basic instructions		91 instructions	
Shortest instruction execution time		100ns (f(XIN)=10MHz)	
Memory capacity	ROM	24 Kbytes	
	RAM	1.5 Kbytes	
I/O port	P0 to P13 (except P77)	8 bits x 4, 2 bits x 1, 6 bits x 3, 7 bits x 2 5 bits x 1, 4 bits x 3	
Input port	P77	1 bit x 1	
Output port	SEG2 to SEG15	2 bits x 7	
Multifunction timer	TA0 to TA7	16 bits x 8	
	TB0 to TB5	16 bits x 6	
Real time port outputs		8 bits x 3 lines, 6 bits x 1 lines	
Serial I/O	UART0 , UART2	(UART or clock synchronous) x 2	
A-D converter		10 bits x 7 channels	
D-A converter		8 bits x 2 channels	
DMAC		2 channel(trigger:24 sources)	
LCD	COM0 to COM3	4 lines	
	SEG2 to SEG47	40 lines (26 lines are shared with I/O ports)	
Watchdog timer		15 bits x 1 (with prescaler)	
Interrupt		24 internal and 8 external sources, 4 software sources	
Clock generating circuit		2 built-in clock generation circuits (built-in feedbackresistor, and external ceramic or quartz oscillator)	
Supply voltage		4.0 to 5.5V (f(XIN)=10MHz)	
		2.7 to 5.5V (f(XIN)=7MHz with software one-wait)	
Power consumption		18 mW (Vcc=3.3V, f(XIN)=7MHz with software one-wait)	
I/O characteristics	I/O withstand voltage (P0 to P13)		
	Output current	P1 to P9,P13	5 mA
		P0, P10 to P12	0.1mA("H" output), 2.5mA("L" output)
Device configuration		CMOS silicon gate	
Package		120-pin plastic mold QFP	

Description

Mitsubishi plans to release the following products in the M30221 group:

- (1) Support for mask ROM version, flash memory version
- (2) Memory capacity
- (3) Package

120P6R-A : Plastic molded QFP (mask ROM and flash memory versions)

Figure 1.1.3 shows the memory expansion and figure 1.1.4 shows the Type No., memory size, and package.

April, 2001

Figure 1.1.3. Memory expansion

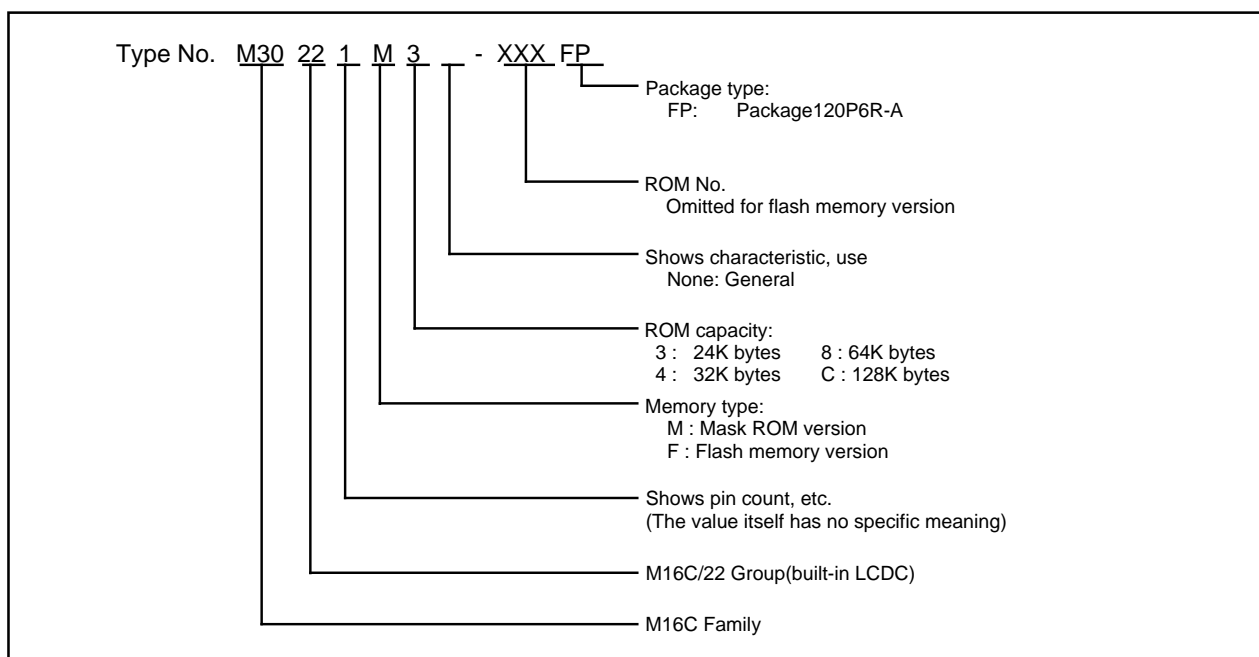

Figure 1.1.4. Type No., memory size, and package

Pin Description

Pin Description

Pin name	Signal name	I/O	Function
VCC, VSS	Power supply input		Supply 2.7 to 5.5 V to the VCC pin. Supply 0 V to the VSS pin.
CNVSS	CNVSS	I	Connect it to the VSS pin.
$\overline{\text{RESET}}$	Reset input	I	A "L" on this input resets the microcomputer.
XIN XOUT	Clock input Clock output	I O	These pins are provided for the main clock generating circuit. Connect a ceramic resonator or crystal between the XIN and the XOUT pins. To use an externally derived clock, input it to the XIN pin and leave the XOUT open.
XCIN XCOUT	Clock input Clock output	I O	These pins are provided for the sub clock generating circuit. Connect a ceramic resonator or crystal between the XCIN and the XCOUT pins. To use an externally derived clock, input it to the XCIN pin and leave the XCOUT open.
AVCC	Analog power supply input		This pin is a power supply input for the A-D converter. Connect it to VCC.
AVSS	Analog power supply input		This pin is a power supply input for the A-D converter. Connect it to VSS.
VREF	Reference voltage input	I	This pin is a reference voltage input for the A-D converter.
P00 to P07	I/O port P0	I/O	This is an 8-bit CMOS I/O port. It has an input/output port direction register that allows the user to set each pin for input or output individually. When set for input, the user can specify in units of four bits via software whether or not they are tied to a pull-up resistor. Pins in this port also use as LCD segment output and real time port output.
P10 to P17	I/O port P1	I/O	This is an 8-bit I/O port equivalent to P0. Pins in this port also function as input pins for the key input interrupt function and real time port output.
P20 to P27	I/O port P2	I/O	This is an 8-bit I/O port equivalent to P0. Pins in this port also function as input pins for the key input interrupt function and real time port output.
P30 to P35	I/O port P3	I/O	This is a 6-bit I/O port equivalent to P0. P30 to P33 also function as input pins for the key input interrupt function.
P41, P42, P46, P47	I/O port P4	I/O	This is a 4-bit I/O port equivalent to P0. The P41 pin is shared with timer A0 input. The P42 pin is shared with timer A1 output. The P46 pin is shared with timer A3 output and INT4. The P47 pin is shared with timer A3 input and INT4.
P50 to P53, P56, P57	I/O port P5	I/O	This is a 6-bit I/O port equivalent to P0. The P50, P51, P52, and P53 pins are shared with timer B0, B1, B2, and B3 input, respectively. The P56 pin is shared with INT3. The P57 pin is shared with CKOUT output.
P60 to P63	I/O port P6	I/O	This is a 4-bit I/O port equivalent to P0. The P60 pin is shared with CTS0 and RTS0. The P61, P62, and P63 pins are shared with CLK0, RxD0, and TxD0, respectively.

Pin Description

Pin Description

Pin name	Signal name	I/O	Function
P70 to P76 P77	I/O port P7	I/O I	P70 to P76 are I/O ports equivalent to P0 (P70 and P71 are N channel open-drain output). The P70, P71, and P72 pins are shared with Tx \overline{D} 2, Rx \overline{D} 2, and CLK2, respectively. The P73 is shared with CTS2 and RTS2. The P74, P75 and P76 pins are shared with INT0, INT1 and INT2, respectively. P77 is an input-only port that also functions for \overline{NMI} .
P80 to P82, P84, P86	I/O port P8	I/O	This is a 5-bit I/O port equivalent to P0. The P80 pin is shared with timer A4 output and INT5 input. The P81 pin is shared with timer A4 input and INT5 input. The P82 pin is shared with timer A5 output. The P84 pin is shared with timer A6 output. The P86 pin is shared with timer A7 output.
P90 to P96	I/O port P9	I/O	This is an 7-bit I/O port equivalent to P0. Pins in this port also function as A-D converter input pins.
P100 to P103	I/O port P10	I/O	This is an 4-bit I/O port equivalent to P0. Pins in this port also function as SEG output for LCD.
P110 to P117	I/O port P11	I/O	This is an 8-bit I/O port equivalent to P0. Pins in this port also function as SEG output for LCD.
P120 to P125	I/O port P12	I/O	This is an 6-bit I/O port equivalent to P0. Pins in this port also function as SEG output for LCD and real time port output.
P130, P131	I/O port P13	I/O	This is an 2-bit I/O port equivalent to P0. P130 pins in this port also function as D-A converter output pins or start trigger for A-D input pins. P131 pins in this port also function as D-A converter output pins.
SEG2 to SEG15	Segment output	O	Pins in this port function as SEG output for LCD drive circuit.
COM0 to COM3	Common output	O	Pins in this port function as common output for LCD drive circuit.
VL1 to VL3	Power supply input for LCD		Power supply input for LCD drive circuit.
C1, C2	Step-up condenser connect port		Pins in this port function as external pin for LCD step-up condenser. Connect a condenser between C1 and C2.

Memory

Operation of Functional Blocks

The M30221 group accommodates certain units in a single chip. These units include ROM and RAM to store instructions and data and the central processing unit (CPU) to execute arithmetic/logic operations. Also included are peripheral units such as timers, real time port, serial I/O, LCD drive control circuit, D-A converter, A-D converter, DMAC and I/O ports.

Memory

Figure 1.4.1 is a memory map of the M30221 group. The address space extends the 1M bytes from address 00000_{16} to $FFFFFF_{16}$. From $FFFFFF_{16}$ down is ROM. For example, in the M30221M3-XXXFP, there is 24K bytes of internal ROM from $FA000_{16}$ to $FFFFFF_{16}$. The vector table for fixed interrupts such as the reset and NMI are mapped to $FFFD_{16}$ to $FFFF_{16}$. The starting address of the interrupt routine is stored here. The address of the vector table for timer interrupts, etc., can be set as desired using the internal register (INTB). See the section on interrupts for details.

From 00400_{16} up is RAM. For example, in the M30221M3-XXXFP, 1.5K bytes of internal RAM is mapped to the space from 00400_{16} to $009FF_{16}$. In addition to storing data, the RAM also stores the stack used when calling subroutines and when interrupts are generated.

The SFR area is mapped to 00000_{16} to $003FF_{16}$. This area accommodates the control registers for peripheral devices such as I/O ports, A-D converter, serial I/O, timers, and LCD, etc. Figures 1.7.1 to 1.7.3 are location of peripheral unit control registers. Any part of the SFR area that is not occupied is reserved and cannot be used for other purposes.

The special page vector table is mapped to $FFE00_{16}$ to $FFFD_{16}$. If the starting addresses of subroutines or the destination addresses of jumps are stored here, subroutine call instructions and jump instructions can be used as 2-byte instructions, reducing the number of program steps.

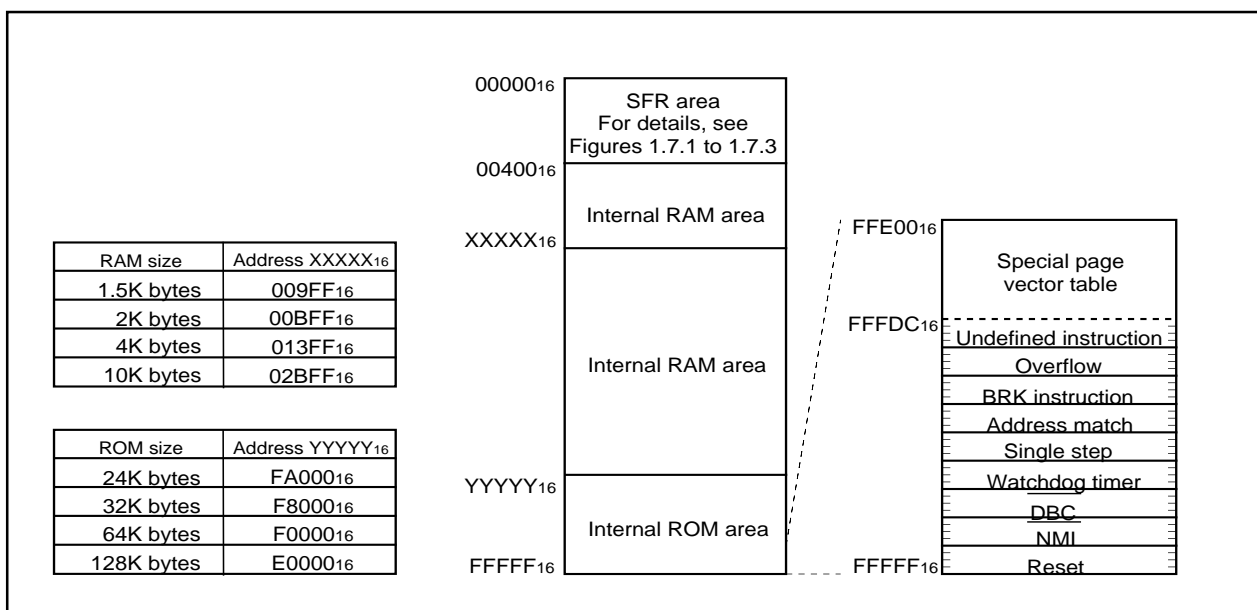

Figure 1.4.1. Memory map

Central Processing Unit (CPU)

The CPU has a total of 13 registers shown in Figure 1.5.1. Seven of these registers (R0, R1, R2, R3, A0, A1, and FB) come in two sets; therefore, these have two register banks.

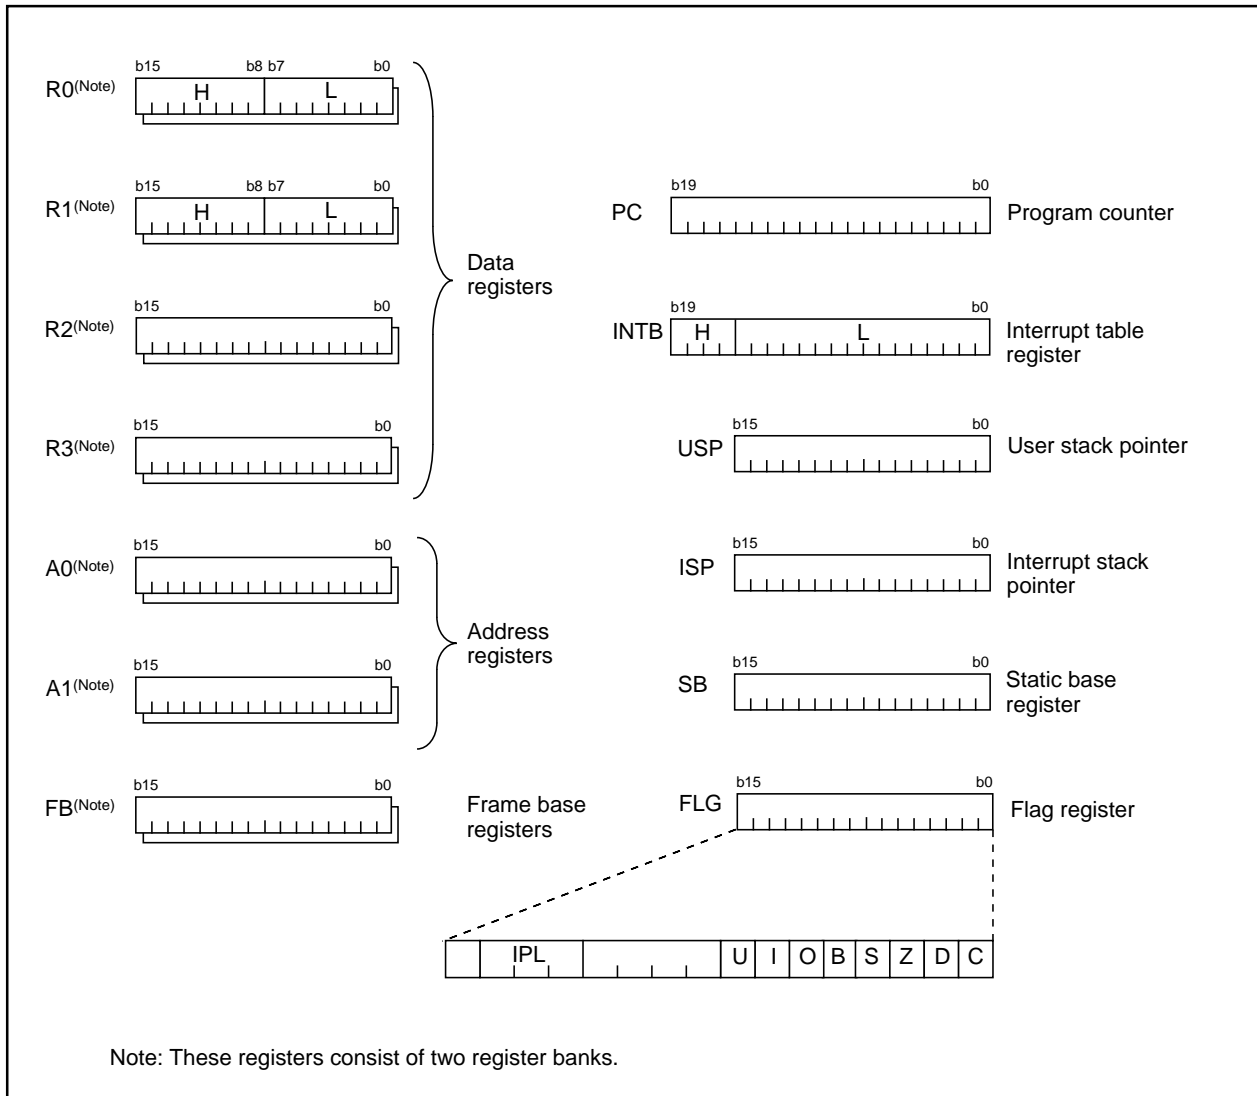

Figure 1.5.1. Central processing unit register

(1) Data registers (R0, R0H, R0L, R1, R1H, R1L, R2, and R3)

Data registers (R0, R1, R2, and R3) are configured with 16 bits, and are used primarily for transfer and arithmetic/logic operations.

Registers R0 and R1 each can be used as separate 8-bit data registers, high-order bits as (R0H/R1H), and low-order bits as (R0L/R1L). In some instructions, registers R2 and R0, as well as R3 and R1 can use as 32-bit data registers (R2R0/R3R1).

(2) Address registers (A0 and A1)

Address registers (A0 and A1) are configured with 16 bits, and have functions equivalent to those of data registers. These registers can also be used for address register indirect addressing and address register relative addressing.

In some instructions, registers A1 and A0 can be combined for use as a 32-bit address register (A1A0).

(3) Frame base register (FB)

Frame base register (FB) is configured with 16 bits, and is used for FB relative addressing.

(4) Program counter (PC)

Program counter (PC) is configured with 20 bits, indicating the address of an instruction to be executed.

(5) Interrupt table register (INTB)

Interrupt table register (INTB) is configured with 20 bits, indicating the start address of an interrupt vector table.

(6) Stack pointer (USP/ISP)

Stack pointer comes in two types: user stack pointer (USP) and interrupt stack pointer (ISP), each configured with 16 bits.

Your desired type of stack pointer (USP or ISP) can be selected by a stack pointer select flag (U flag).

This flag is located at the position of bit 7 in the flag register (FLG).

(7) Static base register (SB)

Static base register (SB) is configured with 16 bits, and is used for SB relative addressing.

(8) Flag register (FLG)

Flag register (FLG) is configured with 11 bits, each bit is used as a flag. Figure 1.5.2 shows the flag register (FLG). The following explains the function of each flag:

- **Bit 0: Carry flag (C flag)**

This flag retains a carry, borrow, or shift-out bit that has occurred in the arithmetic/logic unit.

- **Bit 1: Debug flag (D flag)**

This flag enables a single-step interrupt.

When this flag is "1", a single-step interrupt is generated after instruction execution. This flag is cleared to "0" when the interrupt is acknowledged.

- **Bit 2: Zero flag (Z flag)**

This flag is set to "1" when an arithmetic operation resulted in 0; otherwise, cleared to "0".

- **Bit 3: Sign flag (S flag)**

This flag is set to "1" when an arithmetic operation resulted in a negative value; otherwise, cleared to "0".

- **Bit 4: Register bank select flag (B flag)**

This flag chooses a register bank. Register bank 0 is selected when this flag is "0"; register bank 1 is selected when this flag is "1".

- **Bit 5: Overflow flag (O flag)**

This flag is set to "1" when an arithmetic operation resulted in overflow; otherwise, cleared to "0".

- **Bit 6: Interrupt enable flag (I flag)**

This flag enables a maskable interrupt.

An interrupt is disabled when this flag is "0", and is enabled when this flag is "1". This flag is cleared to "0" when the interrupt is acknowledged.

CPU

- **Bit 7: Stack pointer select flag (U flag)**

Interrupt stack pointer (ISP) is selected when this flag is “0” ; user stack pointer (USP) is selected when this flag is “1”.

This flag is cleared to “0” when a hardware interrupt is acknowledged or an INT instruction of software interrupt Nos. 0 to 31 is executed.

- **Bits 8 to 11: Reserved area**

- **Bits 12 to 14: Processor interrupt priority level (IPL)**

Processor interrupt priority level (IPL) is configured with three bits, for specification of up to eight processor interrupt priority levels from level 0 to level 7.

If a requested interrupt has priority greater than the processor interrupt priority level (IPL), the interrupt is enabled.

- **Bit 15: Reserved area**

The C, Z, S, and O flags are changed when instructions are executed. See the software manual for details.

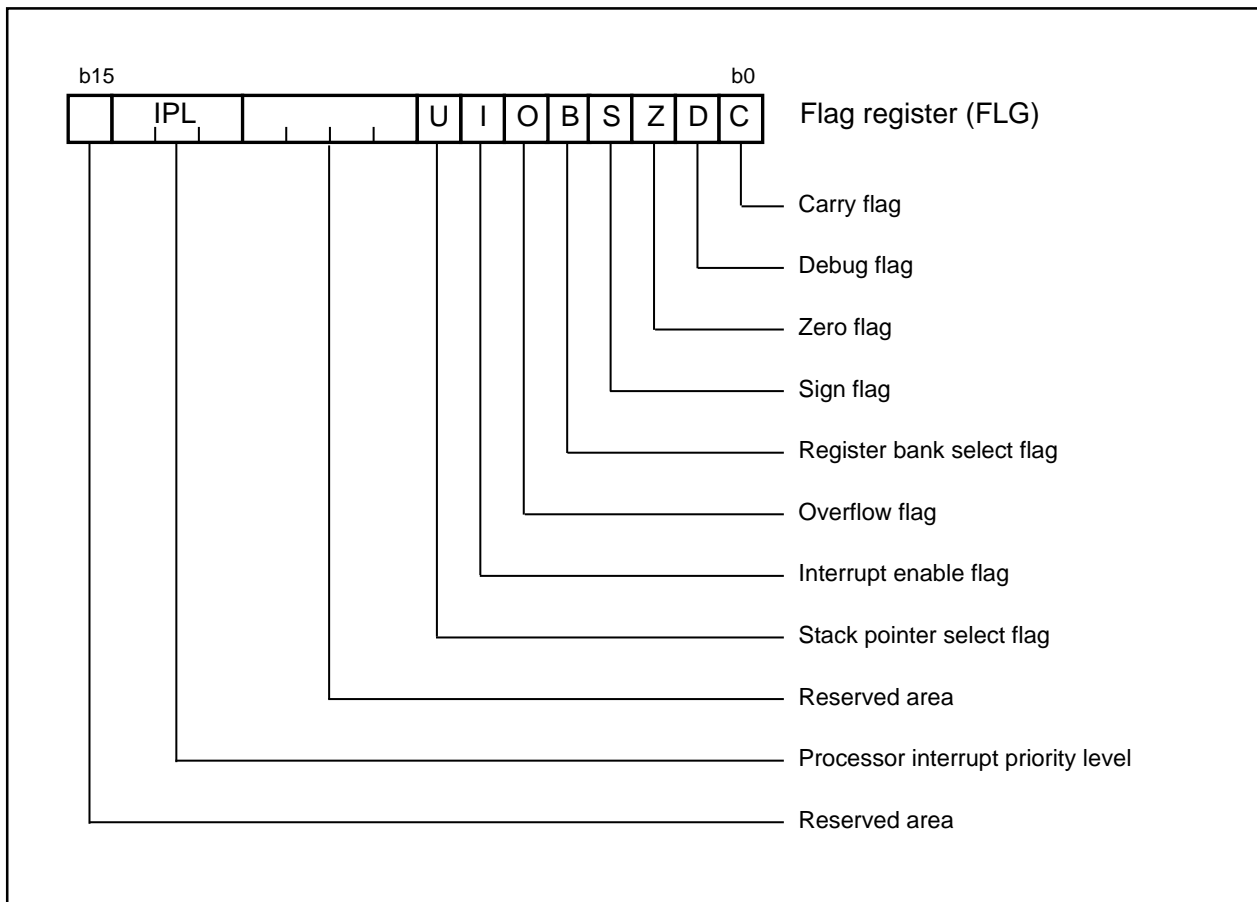

Figure 1.5.2. Flag register (FLG)

Reset

Reset

There are two kinds of resets; hardware and software. In both cases, operation is the same after the reset. (See "Software Reset" for details of software resets.) This section explains on hardware resets.

When the supply voltage is in the range where operation is guaranteed, a reset is effected by holding the reset pin level "L" (0.2V_{CC} max.) for at least 20 cycles. When the reset pin level is then returned to the "H" level while main clock is stable, the reset status is cancelled and program execution resumes from the address in the reset vector table.

Figure 1.6.1 shows the example reset circuit. Figure 1.6.2 shows the reset sequence.

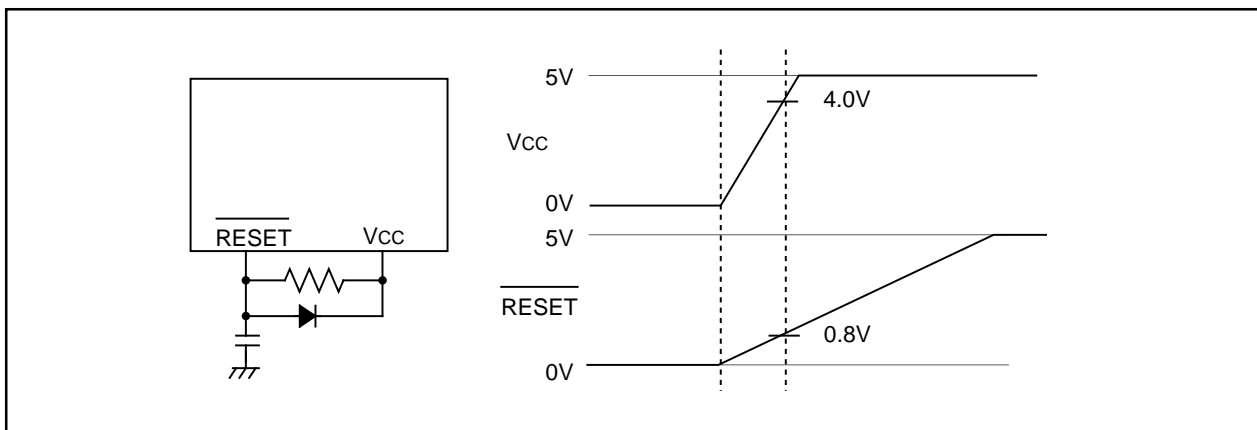

Figure 1.6.1. Example reset circuit

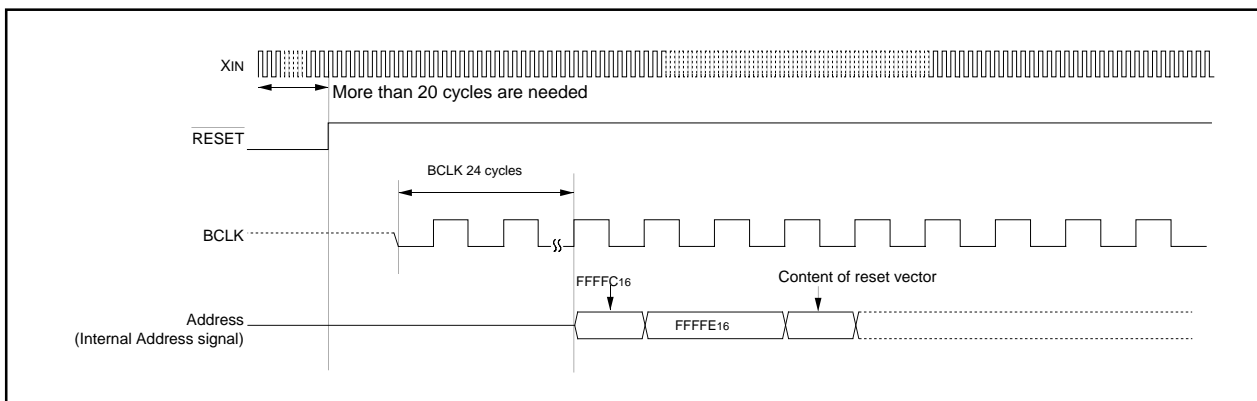

Figure 1.6.2. Reset sequence

Table 1.6.1 shows the statuses of the other pins while the $\overline{\text{RESET}}$ pin level is "L". Figures 1.6.3 and 1.6.4 show the internal status of the microcomputer immediately after the reset is cancelled.

Table 1.6.1. Pin status when $\overline{\text{RESET}}$ pin level is "L"

Pin name	Status
P0, P10 to P12	Input port(with a pull up resistor)
P1 to P9, P13	Input port (floating)
SEG2 to SEG15	"H" level is output
COM0 to COM3	"H" level is output

Figure 1.7.3. Location of peripheral unit control registers (3)

Programmable I/O Port

Programmable I/O Ports

There are 83 programmable I/O ports: P0 to P13 (excluding P77). Each port can be set independently for input or output using the direction register. A pull-up resistance for each block of 4 ports can be set. P77 is an input-only port and has no built-in pull-up resistance.

Figures 1.19.1 to 1.19.4 show the programmable I/O ports. Figure 1.19.5 shows the I/O pins.

Each pin functions as a programmable I/O port and as the I/O for the built-in peripheral devices.

To use the pins as the inputs for the built-in peripheral devices, set the direction register of each pin to input mode. When the pins are used as the outputs for the built-in peripheral devices (other than the D-A converter), they function as outputs regardless of the contents of the direction registers. When pins are to be used as the outputs for the D-A converter, do not set the direction registers to output mode.

(1) Direction registers

These registers are used to choose the direction of the programmable I/O ports. Each bit in these registers corresponds one for one to each I/O pin.

Note: There is no direction register bit for P77.

(2) Port registers

These registers are used to write and read data for input and output to and from an external device. A port register consists of a port latch to hold output data and a circuit to read the status of a pin. Each bit in port registers corresponds one for one to each I/O pin.

(3) Pull-up control registers

The pull-up control register can be set to apply a pull-up resistance to each block of 4 ports. When ports are set to have a pull-up resistance, the pull-up resistance is connected only when the direction register is set for input. The pull-up resistance is not connected for pins that are set for output from peripheral functions, regardless of the setting in the pull-up control register. When pull-up is ON for ports P1 and P2, an intermittent pull-up that pulls up the port for only a set period of time, can be performed from the key input mode register.

(4) Key input mode register

With bits 0 and 1 of this register, it is possible to select both edges or the fall edge of the key input for P1 and P2. Also, with bit 2, it is possible to make the pull-up for a port (P1 or P2), which is set for pull-up using the pull-up control register, automatically connect as an intermittent pull-up. And, using the significant 3 bits, the pull-up resistance can be connected to and disconnected from ports P12 and P13.

(5) Real-time port control register

The real-time port control register can be used to set the registers of ports P0, P1, P2 and P12 for real-time port output, whereby output is synchronized with timer overflow of timers A0, A1, A5 and A6 in the timer mode.

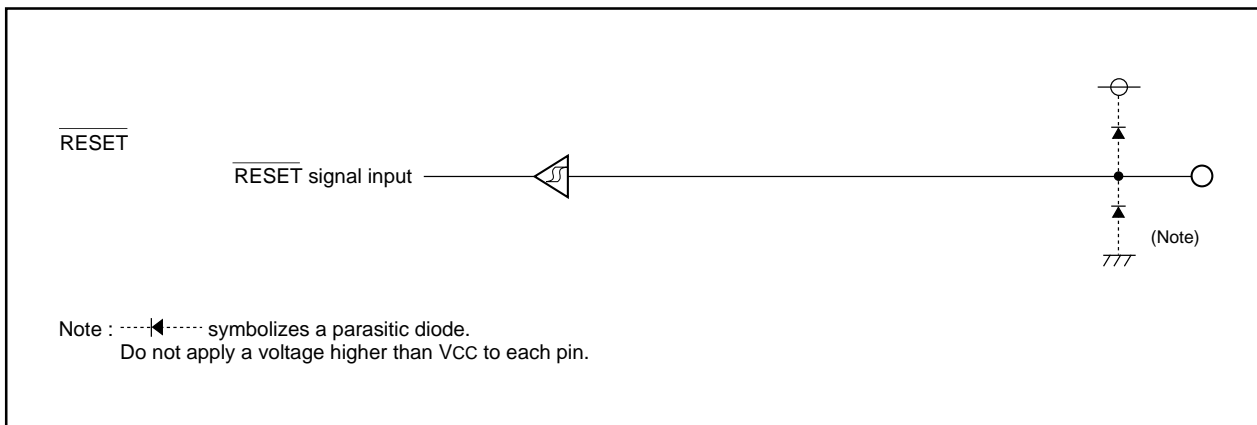

Figure 1.19.5. I/O pins

Programmable I/O Port

Table 1.19.1. Example connection of unused pins in single-chip mode

Pin name	Connection
Ports P0 to P13 (excluding P77)	After setting for output mode, leave these pins open; or after setting for input mode, connect every pin to Vss via a resistor.(Note1,Note3)
XOUT (Note 2),XCOUT	Open
XCIN	Connect via resistor to Vss (pull-down)
$\overline{\text{NMI}}$	Connect via resistor to Vcc (pull-up)
AVCC	Connect to Vcc
AVSS, VREF	Connect to Vss
COM0 ~ COM3	Open
SEG2 ~ SEG15	Open
C1, C2	Open
VL2, VL3	Connect to Vcc
VL1	Connect to Vss
CNVss	Connect via resistor to Vss

Note 1: If setting these pins in output mode and opening them, ports are in input mode until switched into output mode by use of software after reset. Thus the voltage levels of the pins become unstable, and there can be instances in which the power source current increases while the ports are in input mode. In view of an instance in which the contents of the direction registers change due to a runaway generated by noise or other causes, setting the contents of the direction registers periodically by use of software increases program reliability.

Note 2: With external clock input to XIN pin.

Note 3: Output "L" if port P70 and P71 are set to output mode.Port P70 and P71 are N channel open drain.

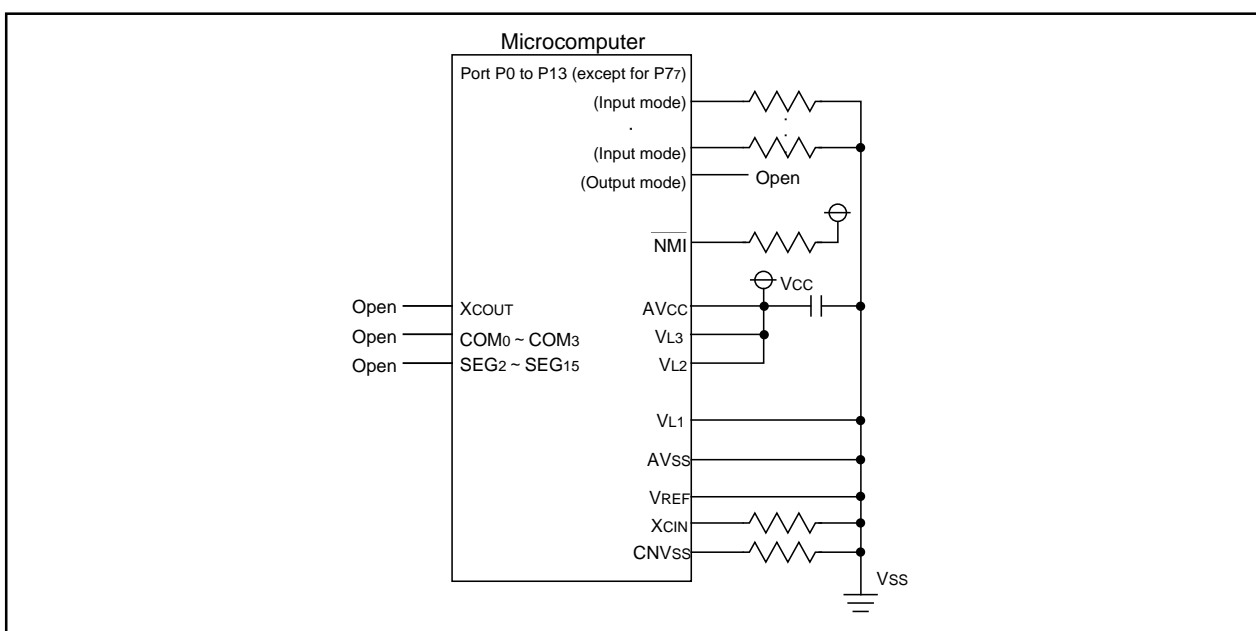

Figure 1.19.13. Example connection of unused pins

Usage precaution

Usage Precaution

Timer A (timer mode)

- (1) Reading the timer Ai register while a count is in progress allows reading, with arbitrary timing, the value of the counter. Reading the timer Ai register with the reload timing gets "FFFF₁₆". Reading the timer Ai register after setting a value in the timer Ai register with a count halted but before the counter starts counting gets a proper value.

Timer A (event counter mode)

- (1) Reading the timer Ai register while a count is in progress allows reading, with arbitrary timing, the value of the counter. Reading the timer Ai register with the reload timing gets "FFFF₁₆" by underflow or "0000₁₆" by overflow. Reading the timer Ai register after setting a value in the timer Ai register with a count halted but before the counter starts counting gets a proper value.
- (2) When stop counting in free run type, set timer again.

Timer A (one-shot timer mode)

- (1) Setting the count start flag to "0" while a count is in progress causes as follows:
 - The counter stops counting and a content of reload register is reloaded.
 - The TAIOUT pin outputs "L" level.
 - The interrupt request generated and the timer Ai interrupt request bit goes to "1".
- (2) The timer Ai interrupt request bit goes to "1" if the timer's operation mode is set using any of the following procedures:
 - Selecting one-shot timer mode after reset.
 - Changing operation mode from timer mode to one-shot timer mode.
 - Changing operation mode from event counter mode to one-shot timer mode.
 Therefore, to use timer Ai interrupt (interrupt request bit), set timer Ai interrupt request bit to "0" after the above listed changes have been made.

Timer A (pulse width modulation mode)

- (1) The timer Ai interrupt request bit becomes "1" if setting operation mode of the timer in compliance with any of the following procedures:
 - Selecting PWM mode after reset.
 - Changing operation mode from timer mode to PWM mode.
 - Changing operation mode from event counter mode to PWM mode.
 Therefore, to use timer Ai interrupt (interrupt request bit), set timer Ai interrupt request bit to "0" after the above listed changes have been made.
- (2) Setting the count start flag to "0" while PWM pulses are being output causes the counter to stop counting. If the TAIOUT pin is outputting an "H" level in this instance, the output level goes to "L", and the timer Ai interrupt request bit goes to "1". If the TAIOUT pin is outputting an "L" level in this instance, the level does not change, and the timer Ai interrupt request bit does not becomes "1".

Timer B (timer mode, event counter mode)

- (1) Reading the timer Bi register while a count is in progress allows reading, with arbitrary timing, the value of the counter. Reading the timer Bi register with the reload timing gets "FFFF₁₆". Reading the timer Bi register after setting a value in the timer Bi register with a count halted but before the counter starts counting gets a proper value.

Usage precaution

Timer B (pulse period/pulse width measurement mode)

- (1) If changing the measurement mode select bit is set after a count is started, the timer Bi interrupt request bit goes to "1".
- (2) When the first effective edge is input after a count is started, an indeterminate value is transferred to the reload register. At this time, timer Bi interrupt request is not generated.

Real time port

- (1) Make sure timer Ai for real time port output is set for timer mode, and is set to have "no gate function" using the gate function select bit.
- (2) Before setting the real time port mode select bit to "1", temporarily turn off the timer Ai used and write its set value to the timer Ai register.

Serial I/O

- (1) In case IIC mode select bit (bit 0 of address 0377₁₆) is set to "1" with UART2. When setting up port direction P7 (address 03EF₁₆), write immediate values. If you use Read/Modify/Write instructions (BSET, BCLR, AND, OR, etc..) on the P7 direction register, the value of P7₁ direction register may change to unknown data.
- (2) MASK ROM version ONRY when IIC mode select bit (bit 0 of address 0377₁₆) and the internal/external select bit (bit 3 of address 0378₁₆) are both set to "1". The function of "SCL wait output bit 2 (bit 5 of address 0376₁₆)" does not work.
- (3) MASK ROM version ONRY when IIC mode select bit (bit 0 of address 0377₁₆) and the internal/external select bit (bit 3 of address 0378₁₆) are both set to "1". According to the datasheet, when IICM is set to "1", the port terminal is readable by the CPU even though "1" is assigned to P7₁ of the direction register. However, the CPU cannot read port P7₁ data if the P7₁ direction register is set to "1".

A-D Converter

- (1) Write to each bit (except bit 6) of A-D control register 0, to each bit of A-D control register 1, and to bit 0 of A-D control register 2 when A-D conversion is stopped (before a trigger occurs).
In particular, when the Vref connection bit is changed from "0" to "1", start A-D conversion after an elapse of 1 μs or longer.
- (2) When changing A-D operation mode, select analog input pin again.
- (3) Using one-shot mode or single sweep mode
Read the correspondence A-D register after confirming A-D conversion is finished. (It is known by A-D conversion interrupt request bit.)
- (4) Using repeat mode, repeat sweep mode 0 or repeat sweep mode 1
Use the undivided main clock as the internal CPU clock.

Stop Mode and Wait Mode

- (1) When returning from stop mode by hardware reset, $\overline{\text{RESET}}$ pin must be set to "L" level until main clock oscillation is stabilized.
- (2) When switching to either wait mode or stop mode, instructions occupying four bytes either from the WAIT instruction or from the instruction that sets the every-clock stop bit to "1" within the instruction queue are prefetched and then the program stops. So put at least four NOPs in succession either to the WAIT instruction or to the instruction that sets the every-clock stop bit to "1".
- (3) When the MCU running in low-speed or low power dissipation mode, do not enter WAIT mode with peripheral function clock stop bit (CM02) set to "1".

Usage precaution

Interrupts

(1) Reading address 00000₁₆

- When maskable interrupt is occurred, CPU read the interrupt information (the interrupt number and interrupt request level) in the interrupt sequence.

The interrupt request bit of the certain interrupt written in address 00000₁₆ will then be set to "0".

Reading address 00000₁₆ by software sets enabled highest priority interrupt source request bit to "0".

Though the interrupt is generated, the interrupt routine may not be executed.

Do not read address 00000₁₆ by software.

(2) Setting the stack pointer

- The value of the stack pointer immediately after reset is initialized to 0000₁₆. Accepting an interrupt before setting a value in the stack pointer may become a factor of runaway. Be sure to set a value in the stack pointer before accepting an interrupt.

When using the $\overline{\text{NMI}}$ interrupt, initialize the stack point at the beginning of a program. Concerning the first instruction immediately after reset, generating any interrupts including the $\overline{\text{NMI}}$ interrupt is prohibited.

(3) The $\overline{\text{NMI}}$ interrupt

- The $\overline{\text{NMI}}$ interrupt can not be disabled. Be sure to connect $\overline{\text{NMI}}$ pin to Vcc via a pull-up resistor if unused.
- Do not get either into stop mode with the $\overline{\text{NMI}}$ pin set to "L".

(4) External interrupt

- When the polarity of the INT0 to INT5 pins is changed, the interrupt request bit is sometimes set to "1". After changing the polarity, set the interrupt request bit to "0".

Usage precaution

(5) Rewrite the interrupt control register

- To rewrite the interrupt control register, do so at a point that does not generate the interrupt request for that register. If there is possibility of the interrupt request occur, rewrite the interrupt control register after the interrupt is disabled. The program examples are described as follow:

Example 1:

```
INT_SWITCH1:
  FCLR  I           ; Disable interrupts.
  AND.B #00h, 0055h ; Clear TA0IC int. priority level and int. request bit.
  NOP                               ; Four NOP instructions are required when using HOLD function.
  NOP
  FSET  I           ; Enable interrupts.
```

Example 2:

```
INT_SWITCH2:
  FCLR  I           ; Disable interrupts.
  AND.B #00h, 0055h ; Clear TA0IC int. priority level and int. request bit.
  MOV.W MEM, R0    ; Dummy read.
  FSET  I           ; Enable interrupts.
```

Example 3:

```
INT_SWITCH3:
  PUSHC FLG        ; Push Flag register onto stack
  FCLR  I           ; Disable interrupts.
  AND.B #00h, 0055h ; Clear TA0IC int. priority level and int. request bit.
  POPC  FLG        ; Enable interrupts.
```

- When a instruction to rewrite the interrupt control register is executed but the interrupt is disabled, the interrupt request bit is not set sometimes even if the interrupt request for that register has been generated. This will depend on the instruction. If this creates problems, use the below instructions to change the register.

Instructions : AND, OR, BCLR, BSET

Table 1.21.1. Absolute maximum ratings

Symbol	Parameter		Condition	Rated value	Unit
V _{cc}	Supply voltage		V _{cc} =AV _{cc}	- 0.3 to 6.5	V
AV _{cc}	Analog supply voltage		V _{cc} =AV _{cc}	- 0.3 to 6.5	V
V _i	Input voltage	RESET, V _{REF} , X _{IN} P0 ₀ to P0 ₇ , P1 ₀ to P1 ₇ , P2 ₀ to P2 ₇ , P3 ₀ to P3 ₅ , P4 ₁ , P4 ₂ , P4 ₆ , P4 ₇ , P5 ₀ to P5 ₃ , P5 ₆ , P5 ₇ , P6 ₀ to P6 ₃ , P7 ₂ to P7 ₇ , P8 ₀ to P8 ₂ , P8 ₄ , P8 ₆ , P9 ₀ to P9 ₆ , P10 ₀ to P10 ₃ , P11 ₀ to P11 ₇ , P12 ₀ to P12 ₅ , P13 ₀ , P13 ₁ (Mask ROM version CNVss)		- 0.3 to V _{cc} +0.3	V
		VL1		- 0.3 to VL2	
		VL2		VL1 to VL3	
		VL3		VL2 to 6.5	
		P7 ₀ , P7 ₁ , C1, C2 (flash memory version CNVss)		- 0.3 to 6.5

RPULLUP	Pull-up resistance P00 to P07, P10 to P17, P20 to P27, P30 to P35, P41, P42, P46, P47, P50 to P53, P56, P57, P60 to P63, P72 to P76, P80 to P82, P84, P86, P90 to P96, P100 to P103, P110 to P117, P120 to P125, P130, P131,	Vi=0V	30.0	50.0	167.0	k
RfXIN	Feedback resistance XIN			1.0		M
RfXCIN	Feedback resistance XCIN			6.0		M
V _{RAM}	RAM retention voltage	When clock is stopped	2.0			V

Note : Has no effect during intermittent pullup operation.

VCC = 5V

Table 1.21.4. Electrical characteristics (referenced to VCC = 5V, VSS = 0V at Ta = 25°C, f(XIN)=10MHz unless otherwise specified)

Symbol	Parameter		Measuring condition	Standard			Unit		
				Min.	Typ.	Max.			
Icc	Power supply current		I/o pin is no load applied	f(XIN)=10MHz Square wave, no division		19.0	38.0	mA	
				Mask ROM version	f(XCIN)=32kHz Square wave		90.0		μA
				Flash memory version	f(XCIN)=32kHz Square wave		200.0		μA
					f(XCIN)=32kHz When a WAIT instruction is executed		4.0		μA
					When clock is stopped Ta=25 °C			1.0	μA
					When clock is stopped Ta=85 °C			20.0	
VL1	Supply voltage (VL1)		When voltage multiplier used	1.3	1.7	2.1	V		
IL1	Power supply current (VL1)		VL1=1.7V,f(LCDCK)=200Hz		3.0	6.0	μA		

Table 1.21.5. A-D conversion characteristics (referenced to VCC = AVCC = VREF = 5V, VSS = AVSS = 0V at Ta = 25°C, f(XIN) = 10MHz unless otherwise specified)

Symbol	Parameter		Measuring condition	Standard			Unit
				Min.	Typ.	Max.	
–	Resolution		VREF = VCC			10	Bits
–	Absolute accuracy	Sample & hold function not available	VREF = VCC = 5V			±3	LSB
		Sample & hold function available(10bit)	VREF = VCC = 5V			±3	LSB
		Sample & hold function available(8bit)	VREF = VCC = 5V			±2	LSB
RLADDER	Ladder resistance		VREF = VCC	10		40	k
tCONV	Conversion time(10bit)			3.3			μs
tCONV	Conversion time(8bit)			2.8			μs
tsAMP	Sampling time			0.3			μs
VREF	Reference voltage			2		VCC	V
VIA	Analog input voltage			0		VREF	V

Table 1.21.6. D-A conversion characteristics (referenced to VCC = AVCC = VREF = 5V, VSS = AVSS = 0V at Ta = 25°C, f(XIN) = 10MHz unless otherwise specified)

Symbol	Parameter		Measuring condition	Standard			Unit
				Min.	Typ.	Max.	
–	Resolution					8	Bits
–	Absolute accuracy					1.0	%
tsu	Setup time					3	μs
Ro	Output resistance			4	10	20	k
IVREF	Reference power supply input current		(Note)			1.5	mA

Note: This applies when using one D-A converter, with the D-A register for the unused D-A converter set to "0016".

The A-D converter's ladder resistance is not included.

Also, when the Vref is unconnected at the A-D control register, IVREF is sent.

VOL	LOW output voltage	XCOUT	HIGHPOWER	With no load applied		0	V
			LOWPOWER	With no load applied		0	
VT+-VT-	Hysteresis	TA0IN, TA3IN, TA4IN, TB0IN to TB3IN, INT0 to INT5, ADTRG, CTS0, CLK0, NMI, TA3OUT, TA4OUT, TA7OUT, KI0 to KI15 (Note), KI16 to KI19		0.2		0.8	V
VT+-VT-	Hysteresis	RESET		0.2		1.8	V
IiH	HIGH input current	P00 to P07, P10 to P17, P20 to P27, P30 to P35, P41, P42, P46, P47, P50 to P53, P56, P57, P60 to P63, P70 to P77, P80 to P82, P84, P86, P90 to P96, P100 to P103, P110 to P117, P120 to P125, P130, P131, XIN, RESET, CNVSS	Vi=3V			4.0	μA
IiL	LOW input current	P00 to P07, P10 to P17, P20 to P27, P30 to P35, P41, P42, P46, P47, P50 to P53, P56, P57, P60 to P63, P70 to P77, P80 to P82, P84, P86, P90 to P96, P100 to P103, P110 to P117, P120 to P125, P130, P131, XIN, RESET, CNVSS	Vi=0V			-4.0	μA
RPULLUP	Pull-up resistance	P00 to P07, P10 to P17, P20 to P27, P30 to P35, P41, P42, P46, P47, P50 to P53, P56, P57, P60 to P63, P72 to P76, P80 to P82, P84, P86, P90 to P96, P100 to P103, P110 to P117, P120 to P125, P130, P131,	Vi=0V	66.0	120.0	500.0	k
RXIN	Feedback resistance	XIN			3.0		M
RXCIN	Feedback resistance	XCIN			10.0		M
V _{RAM}	RAM retention voltage		When clock is stopped	2.0			V

Note : Has no effect during intermittent pullup operation.

VCC = 3V

Table 1.21.20. Electrical characteristics (referenced to VCC = 3V, VSS = 0V at Ta = 25°C, f(XIN) = 7MHz, with wait)

Symbol	Parameter		Measuring condition	Standard			Unit	
				Min.	Typ.	Max.		
Icc	Power supply current	I/o pin is no load applied	f(XIN)=7MHz Square wave, no division		6.0	15.0	mA	
			Mask ROM version f(XCIN)=32kHz Square wave		40.0		μA	
			Flash memory version f(XCIN)=32kHz Square wave		150.0		μA	
			f(XCIN)=32kHz When a WAIT instruction is executed Oscillation capacity High (Note)		2.8		μA	
			f(XCIN)=32kHz When a WAIT instruction is executed Oscillation capacity Low (Note)		0.9		μA	
			When clock is stopped Ta=25 °C				1.0	μA
			When clock is stopped Ta=85 °C				20.0	
VL1	Supply voltage (VL1)	When voltage multiplier used	1.3	1.7	2.1	V		
IL1	Power supply current (VL1)	VL1=1.7V,f(LCDCK)=200Hz		3.0	6.0	μA		

Note: With one timer operated using fc32.

Table 1.21.21. A-D conversion characteristics (referenced to VCC = AVCC = VREF = 3V, VSS = AVSS = 0V at Ta = 25°C, f(XIN) = 7MHz, with wait unless otherwise specified)

Symbol	Parameter		Measuring condition	Standard			Unit
				Min.	Typ.	Max.	
–	Resolution		VREF = VCC			10	Bits
–	Absolute accuracy	Sample & hold function not available(8bit)	VREF = VCC = 3V, AD=fAD/2			±2	LSB
RLADDER	Ladder resistance		VREF = VCC	10		40	k
tCONV	Conversion time(8bit)			14.0			μs
VREF	Reference voltage			2.7		VCC	V
VIA	Analog input voltage			0		VREF	V

Table 1.21.22. D-A conversion characteristics (referenced to VCC = AVCC = VREF = 3V, VSS = AVSS = 0V, at Ta = 25°C, f(XIN) = 7MHz unless otherwise specified)

Symbol	Parameter		Measuring condition	Standard			Unit
				Min.	Typ.	Max.	
–	Resolution					8	Bits
–	Absolute accuracy					1.0	%
tsu	Setup time					3	μs
Ro	Output resistance			4	10	20	k
IVREF	Reference power supply input current	(Note)				1.0	mA

Note : This applies when using one D-A converter, with the D-A register for the unused D-A converter set to "0016". The A-D converter's ladder resistance is not included.

Also, when the Vref is unconnected at the A-D control register, IVREF is sent.

Timing ($V_{CC} = 3V$) $V_{CC} = 3V$ Timing requirements (referenced to $V_{CC} = 3V$, $V_{SS} = 0V$ at $T_a = 25^\circ C$ unless otherwise specified)

Table 1.21.23. External clock input

Symbol	Parameter	Standard		Unit
		Min.	Max.	
t_c	External clock input cycle time	143		ns
$t_w(H)$	External clock input HIGH pulse width	60		ns
$t_w(L)$	External clock input LOW pulse width	60		ns
t_r	External clock rise time		18	ns
t_f	External clock fall time		18	ns

Table 1.21.24. Timer A input (counter input in event counter mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_c(TA)$	TA_{iIN} input cycle time	150		ns
$t_w(TAH)$	TA_{iIN} input HIGH pulse width	60		ns
$t_w(TAL)$	TA_{iIN} input LOW pulse width	60		ns

Table 1.21.25. Timer A input (gating input in timer mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_c(TA)$	TA_{iIN} input cycle time	600		ns
$t_w(TAH)$	TA_{iIN} input HIGH pulse width	300		ns
$t_w(TAL)$	TA_{iIN} input LOW pulse width	300		ns

Table 1.21.26. Timer A input (external trigger input in one-shot timer mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_c(TA)$	TA_{iIN} input cycle time	300		ns
$t_w(TAH)$	TA_{iIN} input HIGH pulse width	150		ns
$t_w(TAL)$	TA_{iIN} input LOW pulse width	150		ns

Table 1.21.27. Timer A input (external trigger input in pulse width modulation mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_w(TAH)$	TA_{iIN} input HIGH pulse width	150		ns
$t_w(TAL)$	TA_{iIN} input LOW pulse width	150		ns

Table 1.21.28. Timer A input (up/down input in event counter mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_c(UP)$	TA_{iOUT} input cycle time	3000		ns
$t_w(UPH)$	TA_{iOUT} input HIGH pulse width	1500		ns
$t_w(UPL)$	TA_{iOUT} input LOW pulse width	1500		ns
$t_{su}(UP-TIN)$	TA_{iOUT} input setup time	600		ns
$t_h(TIN-UP)$	TA_{iOUT} input hold time	600		ns

Timing ($V_{CC} = 3V$) $V_{CC} = 3V$ Timing requirements (referenced to $V_{CC} = 3V$, $V_{SS} = 0V$ at $T_a = 25^{\circ}C$ unless otherwise specified)

Table 1.21.29. Timer B input (counter input in event counter mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{c(TB)}$	TBiIN input cycle time (counted on one edge)	150		ns
$t_{w(TBH)}$	TBiIN input HIGH pulse width (counted on one edge)	60		ns
$t_{w(TBL)}$	TBiIN input LOW pulse width (counted on one edge)	60		ns
$t_{c(TB)}$	TBiIN input cycle time (counted on both edges)	300		ns
$t_{w(TBH)}$	TBiIN input HIGH pulse width (counted on both edges)	160		ns
$t_{w(TBL)}$	TBiIN input LOW pulse width (counted on both edges)	160		ns

Table 1.21.30. Timer B input (pulse period measurement mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{c(TB)}$	TBiIN input cycle time	600		ns
$t_{w(TBH)}$	TBiIN input HIGH pulse width	300		ns
$t_{w(TBL)}$	TBiIN input LOW pulse width	300		ns

Table 1.21.31. Timer B input (pulse width measurement mode)

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{c(TB)}$	TBiIN input cycle time	600		ns
$t_{w(TBH)}$	TBiIN input HIGH pulse width	300		ns
$t_{w(TBL)}$	TBiIN input LOW pulse width	300		ns

Table 1.21.32. A-D trigger input

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{c(AD)}$	\overline{ADTRG} input cycle time (trigger able minimum)	1500		ns
$t_{w(ADL)}$	\overline{ADTRG} input LOW pulse width	200		ns

Table 1.21.33. Serial I/O

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{c(CK)}$	CLKi input cycle time	300		ns
$t_{w(CKH)}$	CLKi input HIGH pulse width	150		ns
$t_{w(CKL)}$	CLKi input LOW pulse width	150		ns
$t_d(C-Q)$	TxDi output delay time		160	ns
$t_h(C-Q)$	TxDi hold time	0		ns
$t_{su}(D-C)$	RxDi input setup time	50		ns
$t_h(C-D)$	RxDi input hold time	90		ns

Table 1.21.34. External interrupt \overline{INTi} inputs

Symbol	Parameter	Standard		Unit
		Min.	Max.	
$t_{w(INH)}$	\overline{INTi} input HIGH pulse width	380		ns
$t_{w(INL)}$	\overline{INTi} input LOW pulse width	380		ns

Timing (VCC = 3V)

VCC = 3V

Usage precaution against the differences between M30220 Group and M30221 Group

Differences between M30220 Group and M30221 Group

Items		M30220 Group			M30221 Group			
Internal Memory	ROM (Byte)	64K***	96K	128K**	24K	32K***	64K***	128K**
	RAM (Byte)	4K***	6K	10K**	1.5K	2K***	4K***	10K**
I/O Ports	Input only / Output only	Input only : 1 / Output only : 16 (shared with LCD outputs)			Input only : 1 / Output only : 14 (shared with LCD outputs)			
	CMOS I/O	102 (32 lines are shared with LCD outputs)			81 (26 lines are shared with LCD outputs)			
	N-channel open-drain				2			
DMAC (channels)					2			
16-bit timers					8+6			
CRC Operation Circuit					-			
Serial I/O	Clock Sync. / UART	3			2			
	Clock Synchronous				-			
	UART only				-			
A-D Converter (resolution × channels)		10bits × 8			10bits × 7			
D-A Converter (resolution × channels)		8bits × 3			8bits × 2			
External Interrupts (source)					8			
Watchdog Timer					Available			
LCD Controller / Driver	Segment (lines)	48			40			
	Common (lines)				4			
	Charge pump				Available			
Real Time Output Ports (bits × ports)		8 × 4			8 × 3, 6 × 1			
Key-on Wake up (lines)					Max.20 (16 lines have Intermittent pull-up operation)			
Sub Clock Generating Circuit					Available

: Under planning (April, 2001)

Deleted pins from M30220 Group

Port	Deleted pin name
P0	-
P1	-
P2	-
P3	-
P4	P40/TA0OUT、 P43/TA1IN、 P44/TA2OUT、 P45/TA2IN
P5	P54/TB4IN、 P55/TB5IN
P6	P64/CTS1/RTS1/CLKS1、 P65/CLK1、 P66/RxD1、 P67/TxD1
P7	-
P8	P83/TA5IN、 P85/TA6IN、 P87/TA7IN
P9	P97/AN7
P10	P104/SEG20、 P105/SEG21、 P106/SEG22、 P107/SEG23
P11	-
P12	P126/SEG38、 P127/SEG39
P13	P132/DA2
others	SEG0、 SEG1、 VSS(1 pin)

Usage precaution against timer A

Mode	Function	Not available timer Ai
Timer mode	Pulse output	Timer A0 and A2 are not available.
	Gate input	Timer A1 , A2 , and A5 to A7 are not available.
Event counter mode	Pulse output	Timer A0 and A2 are not available.
	Count source input	Timer A1 , A2 , and A5 to A7 are not available.
	Up / down count select input	Timer A0 and A2 are not available.
	Two-phase pulse input	Timer A2 and A7 are not available.(Note 1)
One-shot timer mode	Pulse output	Timer A0 and A2 are not available.
	Trigger input	Timer A1 , A2 , and A5 to A7 are not available.
Pulse width modulation mode		Timer A0 and A2 are not available.
	Trigger input	Timer A1 and A5 to A7 are not available.

Note 1 . Timer A3 and A4 are available.

Usage precaution against timer B

Mode	Function	Not available timer Bi
Event counter mode	Count source input	Timer B4 and B5 are not available.
Pulse period / pulse width measurement mode		Timer B4 and B5 are not available.

Usage precaution against real time port outputs

- (1) Pins P126 and P127 are deleted.

Usage precaution against serial I/O

- (1) UART1 is not available.

Usage precaution against LCD controller / driver

- (1) Pins SEG0 , SEG1 , SEG20 to SEG23 , SEG38 and SEG39 are deleted.
- (2) Addresses of the designated RAM for the LCD display 0100₁₆ , 010A₁₆ , 010B₁₆ and 0113₁₆ are reserved area.
- (3) Bit 5 of the segment output enable register (address 0122₁₆) is reserved bit. Must always be clear to "0".

Usage precaution peculiar to M30221 Group

Usage precaution against A-D converter

- (1) AN7 pin is deleted.
- (2) Do not set the analog input pin select bit (bit 0 to 2 at address 03D6₁₆) to "111" in one-shot mode and in repeat mode.
- (3) When the A-D sweep pin select bit (bit 0, 1 at address 03D7₁₆) is set to "11" in single sweep mode, the interrupt request generation timing of the A-D conversion is the A-D conversion time of all 8 pins.
- (4) The sweep time is the A-D conversion time of all 8 pins in repeat sweep mode 1 and when the A-D sweep pin select bit (bit 0, 1 at address 03D7₁₆) is set to "11" in repeat sweep mode 0.

Usage precaution against D-A converter

- (1) DA2 pin is deleted.
- (2) Bit 2 of the D-A control register (address 03DC₁₆) is reserved bit. Must always be clear to "0".
- (3) Address 03DE₁₆ must always be clear to "00₁₆".

Usage precaution against programmable I/O

- (1) Reserved bits of the port Pi direction register and the port Pi register

Register	Bit	Register	Bit
PD0、 P0	-	PD7、 P7	-
PD1、 P1	-	PD8、 P8	b3、 b5、 b7(Note 1)
PD2、 P2	-	PD9、 P9	b7(Note 1)
PD3、 P3	-	PD10、 P10	b4 ~ b7(Note 1)
PD4、 P4	b0、 b3 ~ b5(Note 1)	PD11、 P11	-
PD5、 P5	b4、 b5(Note 1)	PD12、 P12	b6、 b7(Note 1)
PD6、 P6	b4 ~ b7(Note 1)	PD13、 P13	b2(Note 1)

Note 1 . These are reserved bits. Must always be clear to "0".

- (2) Reserved bits of the pull-up control register

Bit 5 of the pull-up control register 1 (address 03FD₁₆) and bit 5 of the pull-up control register 2 (address 03FE₁₆) are reserved bits. Must always be clear to "0".

Keep safety first in your circuit designs!

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Mitsubishi Electric Corporation by various means, including the Mitsubishi Semiconductor home page (<http://www.mitsubishichips.com>).
- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
