

1. Overview

The M16C/62P Group (M16C/62P, M16C/62PT) of single-chip microcomputers are built using the high-performance silicon gate CMOS process using a M16C/60 Series CPU core and are packaged in a 80-pin, 100-pin and 128-pin plastic molded QFP. These single-chip microcomputers operate using sophisticated instructions featuring a high level of instruction efficiency. With 1M bytes of address space, they are capable of executing instructions at high speed. In addition, this microcomputer contains a multiplier and DMAC which combined with fast instruction processing capability, makes it suitable for control of various OA, communication, and industrial equipment which requires high-speed arithmetic/logic operations.

1.1 Applications

Audio, cameras, television, home appliance, office/communications/portable/industrial equipment, automobile, etc

Specifications written in this manual are believed to be accurate, but are not guaranteed to be entirely free of error. Specifications in this manual may be changed for functional or performance improvements. Please make sure your manual is the latest edition.

1.2 Performance Outline

Table 1.1 to table 1.3 list performance outline of M16C/62P group (M16C/62P, M16C/62PT).

Table 1.1 Performance Outline of M16C/62P group (M16C/62P) (128-pin version)

	Item	Performance
		M16C/62P
CPU	Number of Basic Instructions	91 instructions
	Minimum Instruction Execution Time	41.7ns(f(BCLK)=24MHz, VCC1=3.0 to 5.5V) 100ns(f(BCLK)=10MHz, VCC1=2.7 to 5.5V)
	Operation Mode	Single-chip, memory expansion and microprocessor mode
	Memory Space	1 Mbyte (Available to 4 Mbytes by memory space expansion function)
	Memory Capacity	See Table 1.4 and 1.5 Product List
Peripheral Function	Port	Input/Output : 113 pins, Input : 1 pin
	Multifunction Timer	Timer A : 16 bits x 5 channels, Timer B : 16 bits x 6 channels Three phase motor control circuit
	Serial I/O	3 channels Clock synchronous, UART, I ² C bus ⁽¹⁾ , IEBus ⁽²⁾ 2 channels Clock synchronous
	A/D Converter	10-bit A/D converter: 1 circuit, 26 channels
	D/A Converter	8 bits x 2 channels
	DMAC	2 channels
	CRC Calculation Circuit	CCITT-CRC
	Watchdog Timer	15 bits x 1 channel (with prescaler)
	Interrupt	Internal: 29 sources, External: 8 sources, Software: 4 sources, Priority level: 7 levels
	Clock Generation Circuit	4 circuits Main clock generation circuit (*), Subclock generation circuit (*), On-chip oscillator, PLL synthesizer (*)Equipped with a built-in feedback resistor.
	Oscillation Stop Detection Function	Stop detection of main clock oscillation, re-oscillation detection function
	Voltage Detection Circuit	Available (option ⁽⁴⁾)
	Electric Characteristics	Supply Voltage
Power Consumption		14 mA (VCC1=VCC2=5V, f(BCLK)=24MHz) 8 mA (VCC1=VCC2=3V, f(BCLK)=10MHz) 1.8 μA (VCC1=VCC2=3V, f(XCIN)=32kHz, wait mode) 0.7 μA (VCC1=VCC2=3V, stop mode)
Flash Memory Version	Program/Erase Supply Voltage	3.3 ± 0.3 V or 5.0 ± 0.5 V
	Program and Erase Endurance	100 times (all area) or 1,000 times (user ROM area without block 1) / 10,000 times (block A, block 1) ⁽³⁾
Operating Ambient Temperature		-20 to 85°C -40 to 85°C ⁽³⁾
Package		128-pin plastic mold LQFP

1.6 Pin Description

Table 1.10 Pin Description (100-pin and 128-pin Version) (1)

Signal Name	Pin Name	I/O Type	Power Supply ⁽³⁾	Description
Power supply input	VCC1, VCC2 VSS	I	–	Apply 2.7 to 5.5 V to the VCC1 and VCC2 pins and 0 V to the Vss pin. The VCC apply condition is that $VCC1 \geq VCC2$. ⁽²⁾
Analog power supply input	AVCC AVSS	I	VCC1	Applies the power supply for the A/D converter. Connect the AVCC pin to VCC1. Connect the AVSS pin to VSS.
Reset input	RESET	I	VCC1	The microcomputer is in a reset state when applying "L" to the this pin.
CNVSS	CNVSS	I	VCC1	Switches processor mode. Connect this pin to VSS to when after a reset to start up in single-chip mode. Connect this pin to VCC1 to start up in microprocessor mode.
External data bus width select input	BYTE	I	VCC1	Switches the data bus in external memory space. The data bus is 16 bits long when the this pin is held "L" and 8 bits long when the this pin is held "H". Set it to either one. Connect this pin to Vss when an single-chip mode.
Bus control pins ⁽⁴⁾	D0 to D7	I/O	VCC2	Inputs and outputs data (D0 to D7) when these pins are set as the separate bus.
	D8 to D15	I/O	VCC2	Inputs and outputs data (D8 to D15) when external 16-bit data bus is set as the separate bus.
	A0 to A19	O	VCC2	Output address bits (A0 to A19).
	A0/D0 to A7/D7	I/O	VCC2	Input and output data (D0 to D7) and output address bits (A0 to A7) by time-sharing when external 8-bit data bus are set as the multiplexed bus.
	A1/D0 to A8/D7	I/O	VCC2	Input and output data (D0 to D7) and output address bits (A8 to A15) by time-sharing when external 16-bit data bus are set as the multiplexed bus.
	CS0 to CS3	O	VCC2	Output CS0 to CS3 signals. CS0 to CS3 are chip-select signals to specify an external space.
	WRL/WR WRH/BHE RD	O	VCC2	Output WRL, WRH, (WR, BHE), RD signals. WRL and WRH or BHE and WR can be switched by program. <ul style="list-style-type: none"> WRL, WRH and RD are selected The WRL signal becomes "L" by writing data to an even address in an external memory space. The WRH signal becomes "L" by writing data to an odd address in an external memory space. The RD pin signal becomes "L" by reading data in an external memory space. <ul style="list-style-type: none"> WR, BHE and RD are selected The WR signal becomes "L" by writing data in an external memory space. The RD signal becomes "L" by reading data in an external memory space. The BHE signal becomes "L" by accessing an odd address. Select WR, BHE and RD for an external 8-bit data bus.
	ALE	O	VCC2	ALE is a signal to latch the address.
	HOLD	I	VCC2	While the HOLD pin is held "L", the microcomputer is placed in a hold state.
	HLDA	O	VCC2	In a hold state, HLDA outputs a "L" signal.
RDY	I	VCC2	While applying a "L" signal to the RDY pin, the microcomputer is placed in a wait state.

Power Supply : Power supplies which relate to the external bus pins are separated as VCC2, thus they can be interfaced using the different voltage as VCC1.

NOTES:

1. In this manual, hereafter, VCC refers to VCC1 unless otherwise noted.
2. In M16C/62PT, apply 2.7 to 5.5 V to the VCC1 and VCC2 pins. Also the apply condition is that $VCC1 \geq VCC2$.
3. When use $VCC1 > VCC2$, contacts due to some points or restrictions to be checked.
4. Bus control pins in M16C/62T cannot be used.

Table 1.11 Pin Description (100-pin and 128-pin Version) (2)

Signal Name	Pin Name	I/O Type	Power Supply ⁽¹⁾	Description
Main clock input	XIN	I	VCC1	I/O pins for the main clock generation circuit. Connect a ceramic resonator or crystal oscillator between XIN and XOUT ⁽³⁾ . To use the external clock, input the clock from XIN and leave XOUT open.
Main clock output	XOUT	O	VCC1	
Sub clock input	XCIN	I	VCC1	I/O pins for a sub clock oscillation circuit. Connect a crystal oscillator between XCIN and XCOU ⁽³⁾ . To use the external clock, input the clock from XCIN and leave XCOU open.
Sub clock output	XCOU	O	VCC1	
BCLK output ⁽²⁾	BCLK	O	VCC2	Outputs the BCLK signal.
Clock output	CLKOUT	O	VCC2	The clock of the same cycle as fC, f8, or f32 is outputted.
INT interrupt input	INT0 to INT2	I	VCC1	Input pins for the INT interrupt
	INT3 to INT5	I	VCC2	
NMI interrupt input	NMI	I	VCC1	Input pin for the NMI interrupt. Pin states can be read by the P8_5 bit in the P8 register.
Key input interrupt input	KI0 to KI3	I	VCC1	Input pins for the key input interrupt
Timer A	TA0OUT to TA4OUT	I/O	VCC1	These are timer A0 to timer A4 I/O pins. (except the output of TAOUT for the N-channel open drain output.)
	TA0IN to TA4IN	I	VCC1	These are timer A0 to timer A4 input pins.
	ZP	I	VCC1	Input pin for the Z-phase.
Timer B	TB0IN to TB5IN	I	VCC1	These are timer B0 to timer B5 input pins.
Three-phase motor control output	U, \bar{U} , V, \bar{V} , W, \bar{W}	O	VCC1	These are Three-phase motor control output pins.
Serial I/O	CTS0 to CTS2	I	VCC1	These are send control input pins.
	RTS0 to RTS2	O	VCC1	These are receive control output pins.
	CLK0 to CLK4	I/O	VCC1	These are transfer clock I/O pins.

NOTES:

1. There is no external connections for port P1, P4_4 to P4_7, P7_2 to P7_5 and P9_1 in 80-pin version.
Set the direction bits in these ports to "1" (input mode), and set the output data to "0" ("L") using the program.

2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU registers. The CPU has 13 registers. Of these, R0, R1, R2, R3, A0, A1 and FB comprise a register bank. There are two register banks.

Figure 2.1 Central Processing Unit Register

2.1 Data Registers (R0, R1, R2 and R3)

The R0 register consists of 16 bits, and is used mainly for transfers and arithmetic/logic operations. R1 to R3 are the same as R0.

The R0 register can be separated between high (R0H) and low (R0L) for use as two 8-bit data registers. R1H and R1L are the same as R0H and R0L. Conversely, R2 and R0 can be combined for use as a 32-bit data register (R2R0). R3R1 is the same as R2R0.

2.2 Address Registers (A0 and A1)

The register A0 consists of 16 bits, and is used for address register indirect addressing and address register relative addressing. They also are used for transfers and logic/logic operations. A1 is the same as A0. In some instructions, registers A1 and A0 can be combined for use as a 32-bit address register (A1A0).

2.3 Frame Base Register (FB)

FB is configured with 16 bits, and is used for FB relative addressing.

2.4 Interrupt Table Register (INTB)

INTB is configured with 20 bits, indicating the start address of an interrupt vector table.

2.5 Program Counter (PC)

PC is configured with 20 bits, indicating the address of an instruction to be executed.

2.6 User Stack Pointer (USP) and Interrupt Stack Pointer (ISP)

Stack pointer (SP) comes in two types: USP and ISP, each configured with 16 bits.

Your desired type of stack pointer (USP or ISP) can be selected by the U flag of FLG.

2.7 Static Base Register (SB)

SB is configured with 16 bits, and is used for SB relative addressing.

2.8 Flag Register (FLG)

FLG consists of 11 bits, indicating the CPU status.

2.8.1 Carry Flag (C Flag)

This flag retains a carry, borrow, or shift-out bit that has occurred in the arithmetic/logic unit.

2.8.2 Debug Flag (D Flag)

The D flag is used exclusively for debugging purpose. During normal use, it must be set to "0".

2.8.3 Zero Flag (Z Flag)

This flag is set to "1" when an arithmetic operation resulted in 0; otherwise, it is "0".

2.8.4 Sign Flag (S Flag)

This flag is set to "1" when an arithmetic operation resulted in a negative value; otherwise, it is "0".

2.8.5 Register Bank Select Flag (B Flag)

Register bank 0 is selected when this flag is "0"; register bank 1 is selected when this flag is "1".

2.8.6 Overflow Flag (O Flag)

This flag is set to "1" when the operation resulted in an overflow; otherwise, it is "0".

2.8.7 Interrupt Enable Flag (I Flag)

This flag enables a maskable interrupt.

Maskable interrupts are disabled when the I flag is "0", and are enabled when the I flag is "1". The I flag is cleared to "0" when the interrupt request is accepted.

2.8.8 Stack Pointer Select Flag (U Flag)

ISP is selected when the U flag is "0"; USP is selected when the U flag is "1".

The U flag is cleared to "0" when a hardware interrupt request is accepted or an INT instruction for software interrupt Nos. 0 to 31 is executed.

2.8.9 Processor Interrupt Priority Level (IPL)

IPL is configured with three bits, for specification of up to eight processor interrupt priority levels from level 0 to level 7.

If a requested interrupt has priority greater than IPL, the interrupt is enabled.

2.8.10 Reserved Area

When write to this bit, write "0". When read, its content is indeterminate.

3. Memory

Figure 3.1 is a memory map of the M16C/62P group. The address space extends the 1M bytes from address 00000h to FFFFFh.

The internal ROM is allocated in a lower address direction beginning with address FFFFFh. For example, a 64-Kbyte internal ROM is allocated to the addresses from F0000h to FFFFFh.

As for the flash memory version, 4-Kbyte space (block A) exists in 0F000h to 0FFFFh. 4-Kbyte space is mainly for storing data. In addition to storing data, 4-Kbyte space also can store programs.

The fixed interrupt vector table is allocated to the addresses from FFFDCh to FFFFFh. Therefore, store the start address of each interrupt routine here.

The internal RAM is allocated in an upper address direction beginning with address 00400h. For example, a 10-Kbyte internal RAM is allocated to the addresses from 00400h to 02BFFh. In addition to storing data, the internal RAM also stores the stack used when calling subroutines and when interrupts are generated. The SRF is allocated to the addresses from 00000h to 003FFh. Peripheral function control registers are located here. Of the SFR, any area which has no functions allocated is reserved for future use and cannot be used by users.

The special page vector table is allocated to the addresses from FFE00h to FFFDBh. This vector is used by the JMPS or JSRS instruction. For details, refer to the **M16C/60 and M16C/20 Series Software Manual**. In memory expansion and microprocessor modes, some areas are reserved for future use and cannot be used by users. Use M16C/62P (80-pin version) and M16C/62PT in single-chip mode. The memory expansion and microprocessor modes cannot be used.

- The PM00 and PM01 bits do not change at software reset, watchdog timer reset and oscillation stop detection reset.
- The CM20, CM21, and CM27 bits do not change at oscillation stop detection reset.
- The WDC5 bit is "0" (cold start) immediately after power-on. It can only be set to "1" in a program. It is set to "0" when the input voltage at the V_{CC1} pin drops to V_{det2} or less while the VC25 bit in the VCR2 register is set to "1" (RAM retention limit detection circuit enable).
- This register does not change at software reset, watchdog timer reset and oscillation stop detection reset.
- This register in M16C/62PT cannot be used.

NOTES :

- The blank areas are reserved and cannot be accessed by users.
- At hardware reset 1 or hardware reset 2, the register is as follows:
 - "00000000b" where "L" is inputted to the CNVSS pin
 - "00000010b" where "H" is inputted to the CNVSS pin
 At software reset, watchdog timer reset and oscillation stop detection reset, the register is as follows:
 - "00000000b" where the PM01 to PM00 bits in the PM0 register are "00b" (single-chip mode)
 - "00000010b" where the PM01 to PM00 bits in the PM0 register are "01b" (memory expansion mode) or "11b" (microprocessor mode)
- These registers do not exist in M16C/62P (80-pin version), and M16C/62PT (80-pin version).

NOTES:

1. Referenced to $V_{CC1} = AV_{CC} = V_{REF} = 3.3$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$ at $T_{opr} = -20$ to $85^\circ C$ / -40 to $85^\circ C$ unless otherwise specified.
2. If $V_{CC1} > V_{CC2}$, do not use AN0_0 to AN0_7 and AN2_0 to AN2_7 as analog input pins.
3. ϕ_{AD} frequency must be 12 MHz or less. And divide the f_{AD} if V_{CC1} is less than 4.0V, and ϕ_{AD} frequency into 10 MHz or less.
4. When sample & hold function is disabled, ϕ_{AD} frequency must be 250 kHz or more, in addition to the limitation in Note 3. When sample & hold function is enabled, ϕ_{AD} frequency must be 1MHz or more, in addition to the limitation in Note 3.

1. Referenced to $V_{CC1} = V_{REF} = 3.3$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$ at $T_{opr} = -20$ to $85^\circ C$ / -40 to $85^\circ C$ unless otherwise specified.
2. This applies when using one D/A converter, with the D/A register for the unused D/A converter set to "00h". The resistor ladder of the A/D converter is not included. Also, when D/A register contents are not "00h," the I_{VREF} will flow even if V_{ref} is disconnected by the A/D control register.

NOTES :

1. Referenced to V_{CC1}=4.5 to 5.5V, 3.0 to 3.6V at T_{opr} = 0 to 60 °C unless otherwise specified.
2. n denotes the number of block erases.
3. Program and Erase Endurance refers to the number of times a block erase can be performed. If the program and erase endurance is n (n=100, 1,000, or 10,000), each block can be erased n times. For example, if a 4 Kbytes block A is erased after writing 1 word data 2,048 times, each to a different address, this counts as one program and erase endurance. Data cannot be written to the same address more than once without erasing the block. (Rewrite prohibited)
4. Maximum number of E/W cycles for which operation is guaranteed.
5. T_{opr} = -40 to 85 °C (D3, D7, U3, U7) / -20 to 85 °C (D5, D9, U5, U9).
6. Referenced to V_{CC1} = 2.7 to 5.5V at T_{opr} = -20 to 85 °C (D9, U9) / -40 to 85 °C (D7, U7) unless otherwise specified.
7. Table 23.6 applies for block A or block 1 program and erase endurance > 1,000. Otherwise, use Table 23.5.
8. To reduce the number of program and erase endurance when working with systems requiring numerous rewrites, write to unused word addresses within the block instead of rewrite. Erase block only after all possible addresses are used. For example, an 8-word program can be written 256 times maximum before erase becomes necessary. Maintaining an equal number of erasure between block A and block 1 will also improve efficiency. It is important to track the total number of times erasure is used.
9. Should erase error occur during block erase, attempt to execute clear status register command, then block erase command at least three times until erase error disappears.
10. Set the PM17 bit in the PM1 register to "1" (wait state) when executing more than 100 times rewrites (D7, D9, U7 and U9).
11. Customers desiring E/W failure rate information should contact their Renesas technical support representative.

NOTES:

- V_{det4} > V_{det3}.
- Where reset level detection voltage is less than 2.7 V, if the supply power voltage is greater than the reset level detection voltage, the operation at f(BCLK) ≤ 10MHz is guaranteed.
- V_{det3r} > V_{det3} is not guaranteed.

NOTES:

1. Calculated according to the BCLK frequency as follows:

$$\frac{0.5 \times 10^9}{f(BCLK)} - 40 \quad [ns] \quad f(BCLK) \text{ is } 12.5MHz \text{ or less.}$$

2. Calculated according to the BCLK frequency as follows:

$$\frac{0.5 \times 10^9}{f(BCLK)} - 10 \quad [ns]$$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus.

Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.

Hold time of data bus is expressed in

$$t = -CR \times \ln(1 - V_{OL} / V_{CC2})$$

by a circuit of the right figure.

For example, when $V_{OL} = 0.2V_{CC2}$, $C = 30pF$, $R = 1k\Omega$, hold time of output "L" level is

$$t = -30pF \times 1k\Omega \times \ln(1 - 0.2V_{CC2} / V_{CC2}) = 6.7ns.$$

1. Calculated according to the BCLK frequency as follows:

$$\frac{0.5 \times 10^9}{f(\text{BCLK})} - 40 \quad [\text{ns}] \quad f(\text{BCLK}) \text{ is } 12.5\text{MHz or less.}$$

2. Calculated according to the BCLK frequency as follows:

$$\frac{0.5 \times 10^9}{f(\text{BCLK})} - 10 \quad [\text{ns}]$$

3. This standard value shows the timing when the output is off, and does not show hold time of data bus. Hold time of data bus varies with capacitor volume and pull-up (pull-down) resistance value.

Hold time of data bus is expressed in
 $t = -CR \times \ln(1 - V_{OL} / V_{CC2})$

by a circuit of the right figure.

For example, when V_{OL} = 0.2V_{CC2}, C = 30pF, R = 1kΩ, hold time of output "L" level is

$$t = -30\text{pF} \times 1\text{k}\Omega \times \ln(1 - 0.2V_{CC2} / V_{CC2}) = 6.7\text{ns.}$$

NOTES :

1. Referenced to V_{CC1}=4.5 to 5.5V at T_{opr} = 0 to 60 °C unless otherwise specified.
2. n denotes the number of block erases.
3. Program and Erase Endurance refers to the number of times a block erase can be performed.
If the program and erase endurance is n (n=100, 1,000, or 10,000), each block can be erased n times.
For example, if a 4 Kbytes block A is erased after writing 1 word data 2,048 times, each to a different address, this counts as one program and erase endurance. Data cannot be written to the same address more than once without erasing the block. (Rewrite prohibited)
4. Maximum number of E/W cycles for which operation is guaranteed.
5. T_{opr} = -40 to 85 °C (T version) / -40 to 125 °C (V version).
6. Referenced to V_{CC1} = 4.0 to 5.5V at T_{opr} = -40 to 85 °C (T version) / -40 to 125 °C (V version) unless otherwise specified.
7. Table 23.53 applies for block A or block 1 program and erase endurance > 1,000. Otherwise, use Table 23.52.
8. To reduce the number of program and erase endurance when working with systems requiring numerous rewrites, write to unused word addresses within the block instead of rewrite. Erase block only after all possible addresses are used. For example, an 8-word program can be written 256 times maximum before erase becomes necessary. Maintaining an equal number of erasure between block A and block 1 will also improve efficiency. It is important to track the total number of times erasure is used.
9. Should erase error occur during block erase, attempt to execute clear status register command, then block erase command at least three times until erase error disappears.
10. Set the PM17 bit in the PM1 register to "1" (wait state) when executing more than 100 times rewrites (B7 and U7).
11. Customers desiring E/W failure rate information should contact their Renesas technical support representative.

Keep safety first in your circuit designs!

1. Renesas Technology Corp. puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corp. product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corp. or a third party.
 2. Renesas Technology Corp. assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
 3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corp. without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors.
Renesas Technology Corp. assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corp. by various means, including the Renesas Technology Corp. Semiconductor home page (<http://www.renesas.com>).
 4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corp. assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
 5. Renesas Technology Corp. semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
 6. The prior written approval of Renesas Technology Corp. is necessary to reprint or reproduce in whole or in part these materials.
 7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
 8. Please contact Renesas Technology Corp. for further details on these materials or the products contained therein.
