

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 1. DESCRIPTION

The M37225M6-XXXSP, M37225M8-XXXSP, and M37225ECSP are single-chip microcomputers designed with CMOS silicon gate technology. They have a OSD, I<sup>2</sup>C-BUS interface, PWM output, and 12 V withstand, so it is useful for a channel selection system for TV.

The features of the M37225ECSP are similar to those of the M37225M6-XXXSP except that the chip has a built-in PROM which can be written electrically. The difference between M37225M6-XXXSP and M37225M8-XXXSP are the ROM size. Accordingly, the following descriptions will be for the M37225M6-XXXSP.

## 2. FEATURES

- Number of basic instructions ..... 71
- Memory size
  - ROM ..... 24K bytes (M37225M6-XXXSP)  
32K bytes (M37225M8-XXXSP)  
48K bytes (M37225ECSP)
  - RAM ..... 1024 bytes (M37225M6-XXXSP,  
M37225M8-XXXSP)  
2048 bytes (M37225ECSP)
 (\*ROM correction memory included)
- Minimum instruction execution time  
..... 0.5 μs (at 8 MHz oscillation frequency)
- Power source voltage ..... 5 V ± 10 %
- Subroutine nesting ..... 128 levels (Max.)
- Interrupts ..... 16 types, 16 vectors
- 8-bit timers ..... 4
- Programmable I/O ports (Ports P0, P1, P2, P30–P32, P35) ..... 28
- Input ports (Ports P33, P34, P50, P51) ..... 4
- Output ports (Ports P52–P55) ..... 4
- 12 V withstand ports ..... 6
- LED drive ports ..... 4
- Serial I/O ..... 8-bit X 1 channel
- Multi-master I<sup>2</sup>C-BUS interface ..... 1 (2 systems)
- A-D converter (8-bit resolution) ..... 8 channels
- PWM output circuit ..... 14-bit X 2, 8-bit X 6
- Power dissipation
  - In operating ..... 165 mW  
(at V<sub>CC</sub> = 5.5V, 8 MHz oscillation frequency, and OSD on)
- ROM correction function ..... 3 vectors
- Immediate return mode from wait state

### ● OSD function

- Display characters ..... 24 characters X 2 lines  
(It is possible to display 3 lines or more by software)
- Kinds of characters ..... 381 kinds
- Character display area 16 X 20 dots
- Kinds of character sizes ..... Block display: 3 kinds  
SPRITE display: 1 kinds
- Kinds of character colors. .... 8 colors (R, G, B)
- Coloring unit ..... character, character background, raster
- Display position
  - Horizontal: 64 levels    Vertical :255 levels
- Attribute ..... Border (all-bordered, shadow-bordered), BUTTON
- SPRITE display function
- Wallpaper function
- Window function
- Corresponding to bi-scan mode

## 6. PERFORMANCE OVERVIEW

Table 6.1 Performance Overview

Parameter		Functions	
Number of basic instructions		71	
Instruction execution time		0.5 μs (the minimum instruction execution time, at 8 MHz oscillation frequency)	
Clock frequency		8 MHz (maximum)	
Memory size	ROM	M37225M6-XXXSP	24K bytes
		M37225M8-XXXSP	32K bytes
		M37225ECSP	48K bytes
	RAM	M37225M6-XXXSP, M37225M8-XXXSP	1024 bytes (ROM correction memory included)
		M37225ECSP	2048 bytes (ROM correction memory included)
	OSD ROM		15K bytes
OSD RAM		96 bytes	
Input/Output ports	P00-P05	I/O	6-bit X 1 (N-channel open-drain output structure, can be used as PWM output pins)
	P06, P07	I/O	2-bit X 1 (N-channel open-drain output structure, can be used as INT input pins, A-D input pin)
	P1	I/O	8-bit X 1 (CMOS input/output structure, can be used as OSD output pin, INT input pin, A-D input pins, DA output pin, multi-master I <sup>2</sup> C-BUS interface)
	P2	I/O	8-bit X 1 (CMOS input/output structure, can be used as serial I/O pins, timer external clock input pins)
	P30, P31, P35	I/O	3-bit X 1 (CMOS output structure, or N-channel open-drain output structure, can be used as A-D input pins, DA output pin)
	P32	I/O	1-bit X 1 (N-channel open-drain output structure, can be used as A-D input pin)
	P33, P34	Input	2-bit X 1 (Can be used as OSD clock input/output pins)
	P50, P51	Input	2-bit X 1 (N-channel open-drain output structure, can be used as horizontal • vertical synchronous signal input pins)
	P52-P55	Output	4-bit X 1 (CMOS output structure, can be used as OSD output pins)
Serial I/O		8-bit X 1	
Multi-master I <sup>2</sup> C-BUS interface		1 (2 systems)	
A-D converter		8 channels (8-bit resolution)	
PWM output circuit		14-bit X 2, 8-bit X 6	
Timers		8-bit timer X 4	
ROM correction function		3 vectors	
Subroutine nesting		128 levels (maximum)	
Interrupt		<16 types> INT external interrupt X 3, Internal timer interrupt X 6, Serial I/O interrupt X 1, OSD interrupt X 1, Multi-master I <sup>2</sup> C-BUS interface interrupt X 1, f(XIN)/4096 interrupt X 1, SPRITE OSD interrupt X 1, A-D conversion interrupt X 1, Vsync interrupt X 1, BRK instruction interrupt X 1, reset X 1	
Clock generating circuit		2 built-in circuits (externally connected to a ceramic resonator or a quartz-crystal oscillator)

## 7. PIN DESCRIPTION

Table 7.1 Pin Description

Pin	Name	Input/ Output	Functions
VCC, Vss	Power source		Apply voltage of 5 V ± 10 % to (typical) VCC, and 0 V to Vss.
CNVss	CNVss		This is connected to Vss.
RESET	Reset input	Input	To enter the reset state, the reset input pin must be kept at a LOW for 2 μs or more (under normal VCC conditions). If more time is needed for the quartz-crystal oscillator to stabilize, this LOW condition should be maintained for the required time.
XIN	Clock input	Input	This chip has an internal clock generating circuit. To control generating frequency, an external ceramic resonator or a quartz-crystal oscillator is connected between pins XIN and XOUT. If an external clock is used, the clock source should be connected to the XIN pin and the XOUT pin should be left open.
XOUT	Clock output	Output	
P00/PWM0- P05/PWM5, P06/INT2/A-D4, P07/INT1	I/O port P0	I/O	Port P0 is an 8-bit I/O port with direction register allowing each I/O bit to be individually programmed as input or output. At reset, this port is set to input mode. The output structure is N-channel open-drain output. (See note 1)
	PWM output	Output	Pins P00-P05 are also used as PWM output pins PWM0-PWM5 respectively. The output structure is N-channel open-drain output.
	External interrupt input	Input	Pins P06 and P07 are also used as INT external interrupt input pins INT2 and INT1 respectively.
	Analog input	Input	P06 pin is also used as analog input pin A-D4.
P10/OUT2/A-D8, P11/SCL1, P12/SCL2, P13/SDA1, P14/SDA2, P15/INT3/A-D1, P16/A-D2, P17/DA2/A-D3	I/O port P1	I/O	Port P1 is an 8-bit I/O port and has basically the same functions as port P0. The output structure is CMOS output. (See note 1)
	OSD output	Output	Pins P10 is also used as OSD output pin OUT2. The output structure is CMOS output.
	Multi-master I <sup>2</sup> C-BUS interface	I/O	Pins P11-P14 are used as SCL1, SCL2, SDA1 and SDA2 respectively, when multi-master I <sup>2</sup> C-BUS interface is used. The output structure is N-channel open-drain output.
	Analog input	Input	Pins P10, P15-P17 are also used as analog input pin A-D8, A-D1-A-D3 respectively.
	External interrupt input	Input	P15 pin is also used as INT external interrupt input pin INT3.
P20/SCLK,  P22/SIN, P23/TIM3, P24/TIM2, P25-P27	DA output	Output	Pins P17 is also used as 14-bit PWM output pin DA2. The output structure is CMOS output.
	I/O port P2	I/O	Port P2 is an 8-bit I/O port and has basically the same functions as port P0. The P21/SOUT(/SIN), output structure is CMOS output. (See note 1)
	Serial I/O synchronous clock input/output port	I/O	P20 pin is also used as serial I/O synchronous clock input/output pin SCLK. The output structure is N-channel open-drain output.
	Serial I/O data input/output	I/O	P21 pin is also used as serial I/O data input/output pin SOUT (/SIN). The output structure is N-channel open-drain output.
	Serial I/O data input	Input	P22 pin is also used as serial I/O data input pin SIN.
P30/A-D5, P31/A-D6, P32/A-D7, DA1/P35	External clock input for timer	Input	Pins P23 and P24 are also used as timer external clock input pins TIM3 and TIM2 respectively.
	I/O port P3	I/O	Ports P30-P32 and P35 are a 3-bit I/O port and has basically the same functions as port 0 (see note 1). Either CMOS output or N-channel open-drain output structure can be selected as ports P30, P31 and P35. The output structure of port P32 is N-channel open-drain output structure.(See notes 1, 2)
	Analog input	Input	Pins P30-P32 are also used as analog input pins A-D5-A-D7 respectively.
OSC1/P33, OSC2/P34,	DA output	Output	P35 pin is also used as 14-bit PWM output pin DA1. The output structure is CMOS output. At reset, output is undefined.
	Input port P3	Input	Pins P33 and P34 are a 2-bit input port.
	Clock input for OSD	Input	P33 pin is also used as OSD clock input pin OSC1.
	Clock output for OSD	Output	P34 pin is also used as OSD clock output pin OSC2. The output structure is CMOS output.

M37225ECSP**

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

**Table 7.2 Pin Description (continued)**

Pin	Name	Input/ Output	Functions
HSYNC/P50, VSYNC/P51	Input port P5	Input	Ports P50 and P51 are a 2-bit input port.
	HSYNC input	Input	This is a horizontal synchronizing signal input for OSD.
	VSYNC input	Input	This is a vertical synchronizing signal input for OSD.
R/P52, G/P53, B/P54, OUT1/P55	Output port P5	Output	Ports P52-P55 are a 4-bit output port. The output structure is CMOS output.
	OSD output	Output	Pins P52-P55 are also used as OSD output pins R, G, B, OUT1 respectively. The output structure is CMOS output. At reset, output is LOW.

**Notes 1:** Port Pi (i = 0 to 3) has the port Pi direction register which can be used to program each bit as an input ("0") or an output ("1"). The pins programmed as "1" in the direction register are output pins. When pins are programmed as "0," they are input pins. When pins are programmed as output pins, the output data are written into the port latch and then output. When data is read from the output pins, the output pin level is not read but the data of the port latch is read. This allows a previously-output value to be read correctly even if the output LOW voltage has risen, for example, because a light emitting diode was directly driven. The input pins are in the floating state, so the values of the pins can be read. When data is written into the input pin, it is written only into the port latch, while the pin remains in the floating state.

**2:** To switch output structures, set by the following bits.

P30 : bit 6 of port P3 direction register

P31 : bit 7 of port P3 direction register

P35 : bit 5 of port P35 output mode control register

When "0," CMOS output; when "1," N-channel open-drain output.

## 8. FUNCTIONAL DESCRIPTION

### 8.1 CENTRAL PROCESSING UNIT (CPU)

This microcomputer uses the standard 740 Family instruction set. Refer to the table of 740 Family addressing modes and machine instructions or the SERIES 740 <Software> User's Manual for details on the instruction set.

Machine-resident 740 Family instructions are as follows:

The FST, SLW instruction cannot be used.

The MUL, DIV, WIT and STP instructions can be used.

### 8.1.1 CPU Mode Register

The CPU mode register contains the stack page selection bit and internal system clock selection bit. The CPU mode register is allocated at address 00FB16.

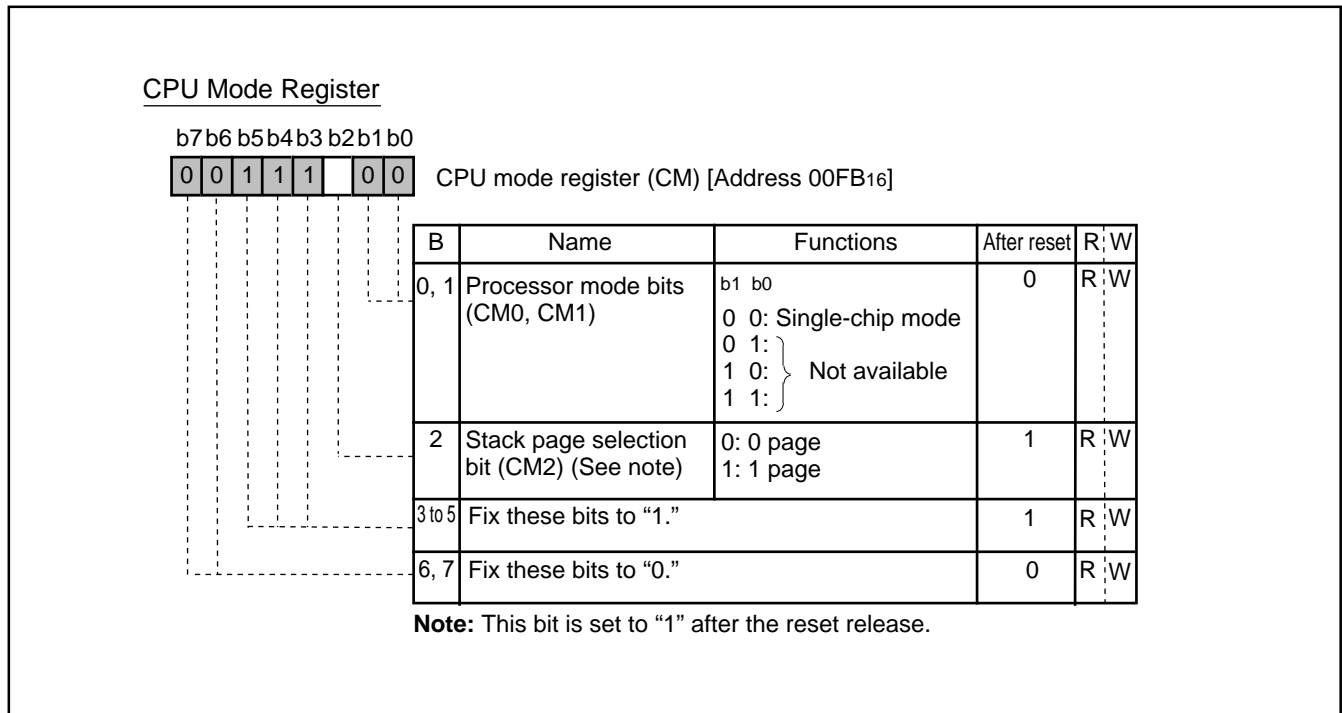

Fig. 8.1.1 CPU Mode Register

## 8.2 MEMORY

### 8.2.1 Special Function Register (SFR) Area

The special function register (SFR) area in the zero page contains control registers such as I/O ports and timers.

### 8.2.2 RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

### 8.2.3 ROM

ROM is used for storing user programs as well as the interrupt vector area.

### 8.2.4 OSD RAM

RAM for display is used for specifying the character codes and colors to display.

### 8.2.5 OSD ROM

ROM for display is used for storing character data.

### 8.2.6 Interrupt Vector Area

The interrupt vector area contains reset and interrupt vectors.

### 8.2.7 Zero Page

The 256 bytes from addresses 0000<sub>16</sub> to 00FF<sub>16</sub> are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

### 8.2.8 Special Page

The 256 bytes from addresses FF00<sub>16</sub> to FFFF<sub>16</sub> are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

### 8.2.9 ROM Correction Vector

This is used as the program jump destination addresses for ROM correction.

## 8.3 INTERRUPTS

Interrupts can be caused by 16 different sources consisting of 3 external, 14 internal, 1 software, and reset. Interrupts are vectored interrupts with priorities as shown in Table 8.3.1. Reset is also included in the table because its operation is similar to an interrupt.

When an interrupt is accepted,

- ① The contents of the program counter and processor status register are automatically stored into the stack.
- ② The interrupt disable flag I is set to "1" and the corresponding interrupt request bit is set to "0."
- ③ The jump destination address stored in the vector address enters the program counter.

Other interrupts are disabled when the interrupt disable flag is set to "1."

All interrupts except the BRK instruction interrupt have an interrupt request bit and an interrupt enable bit. The interrupt request bits are in interrupt request registers 1 and 2 and the interrupt enable bits are in interrupt control registers 1 and 2. Figures 8.3.2 to 8.3.6 show the interrupt-related registers.

Interrupts other than the BRK instruction interrupt and reset are accepted when the interrupt enable bit is "1," interrupt request bit is "1," and the interrupt disable flag is "0." The interrupt request bit can be set to "0" by a program, but not set to "1." The interrupt enable bit can be set to "0" and "1" by a program.

Reset is treated as a non-maskable interrupt with the highest priority.

Figure 8.3.1 shows interrupt control.

### 8.3.1 Interrupt Causes

#### (1) VSYNC, OSD, SPRITE OSD Interrupts

The VSYNC interrupt is an interrupt request synchronized with the vertical sync signal.

The OSD interrupt occurs after character block display to the CRT is completed.

The SPRITE OSD interrupt occurs at the completion of SPRITE display.

#### (2) INT1 to INT3 External Interrupts

The INT1 to INT3 interrupts are external interrupt inputs, the system detects that the level of a pin changes from LOW to HIGH or from HIGH to LOW, and generates an interrupt request. The input active edge can be selected by bits 3 to 5 of the interrupt input polarity register (address 00CD16) : when this bit is "0," a change from LOW to HIGH is detected; when it is "1," a change from HIGH to LOW is detected. Note that both bits are cleared to "0" at reset.

#### (3) Timers 1 to 4 Interrupts

An interrupt is generated by an overflow of timers 1 to 4.

**Table 8.3.1 Interrupt Vector Addresses and Priority**

Priority	Interrupt Source	Vector Addresses	Remarks
1	Reset	FFFF <sub>16</sub> , FFFE <sub>16</sub>	Non-maskable
2	OSD interrupt	FFFD <sub>16</sub> , FFFC <sub>16</sub>	
3	INT2 external interrupt	FFFB <sub>16</sub> , FFFA <sub>16</sub>	Active edge selectable
4	INT1 external interrupt	FFF9 <sub>16</sub> , FFF8 <sub>16</sub>	Active edge selectable

15	A-D conversion interrupt	FFE3 <sub>16</sub> , FFE2 <sub>16</sub>	
16	BRK instruction interrupt	FFDF <sub>16</sub> , FFDE <sub>16</sub>	Non-maskable

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## (4) Serial I/O Interrupt

This is an interrupt request from the clock synchronous serial I/O function.

## (5) $f(X_{IN})/4096$ Interrupt

The  $f(X_{IN})/4096$  interrupt occurs regularly with a  $f(X_{IN})/4096$  period. Set bit 0 of the PWM mode register 1 to "0."

## (6) Multi-master I<sup>2</sup>C-BUS Interface Interrupt

This is an interrupt request related to the multi-master I<sup>2</sup>C-BUS interface.

## (7) A-D Conversion Interrupt

The A-D conversion interrupt occurs at the completion of A-D conversion.

## (8) BRK Instruction Interrupt

This software interrupt has the least significant priority. It does not have a corresponding interrupt enable bit, and it is not affected by the interrupt disable flag I (non-maskable).

## 8.4 TIMERS

This microcomputer has 4 timers: timers 1 to 4. All timers are 8-bit timers with the 8-bit timer latch. The timer block diagram is shown in Figure 8.4.3.

All of the timers count down and their divide ratio is  $1/(n+1)$ , where  $n$  is the value of timer latch. By writing a count value to the corresponding timer latch (addresses 00F0<sub>16</sub> to 00F3<sub>16</sub>: timers 1 to 4), the value is also set to a timer, simultaneously.

The count value is decremented by 1. The timer interrupt request bit is set to "1" by a timer overflow at the next count pulse, after the count value reaches "00<sub>16</sub>."

### 8.4.1 Timer 1

Timer 1 can select one of the following count sources:

- $f(XIN)/16$
- $f(XIN)/4096$  or  $f(XCIN)/4096$

The count source of timer 1 is selected by setting bit 0 of timer mode register 1 (address 00F4<sub>16</sub>).

Timer 1 interrupt request occurs at timer 1 overflow.

### 8.4.2 Timer 2

Timer 2 can select one of the following count sources:

- $f(XIN)/16$
- Timer 1 overflow signal
- External clock from the TIM2 pin

The count source of timer 2 is selected by setting bits 4 and 1 of timer mode register 1 (address 00F4<sub>16</sub>). When timer 1 overflow signal is a count source for the timer 2, the timer 1 functions as an 8-bit prescaler.

Timer 2 interrupt request occurs at timer 2 overflow.

### 8.4.3 Timer 3

Timer 3 can select one of the following count sources:

- $f(XIN)/16$
- External clock from the HSYNC pin
- External clock from the TIM3 pin

The count source of timer 3 is selected by setting bits 5 and 0 of timer mode register 2 (address 00F5<sub>16</sub>).

Timer 3 interrupt request occurs at timer 3 overflow.

### 8.4.4 Timer 4

Timer 4 can select one of the following count sources:

- $f(XIN)/16$
- $f(XIN)/2$
- Timer 3 overflow signal

The count source of timer 4 is selected by setting bits 1 and 4 of timer mode register 2 (address 00F5<sub>16</sub>). When timer 3 overflow signal is a count source for the timer 4, the timer 3 functions as an 8-bit prescaler.

Timer 4 interrupt request occurs at timer 4 overflow.

At reset, timers 3 and 4 are connected by hardware and "FF<sub>16</sub>" is automatically set in timer 3; "07<sub>16</sub>" in timer 4. The  $f(XIN)/16$  is selected as the timer 3 count source. The internal reset is released by timer 4 overflow in this state and the internal clock is connected.

At execution of the STP instruction, timers 3 and 4 are connected by hardware and "FF<sub>16</sub>" is automatically set in timer 3; "07<sub>16</sub>" in timer 4. However, the  $f(XIN)/16$  is not selected as the timer 3 count source. So set both bit 0 of timer mode register 2 (address 00F5<sub>16</sub>) and bit 6 at address 00C7<sub>16</sub> to "0" before execution of the STP instruction ( $f(XIN)/16$  is selected as the timer 3 count source). The internal STP state is released by timer 4 overflow in this state and the internal clock is connected.

As a result of the above procedure, the program can start under a stable clock.

However, when setting "1" to bit 5 of timer mode register 1 (address 00F4<sub>16</sub>), timers 3 and 4 are not set the above value, the STP state is set by executing the STP instruction. This allows to program the time to return from the STP state.

The timer-related registers is shown in Figures 8.4.1 and 8.4.2.

## 8.5 SERIAL I/O

This microcomputer has a built-in serial I/O which can either transmit or receive 8-bit data serially in the clock synchronous mode.

The serial I/O block diagram is shown in Figure 8.5.1. The synchronous clock I/O pin (SCLK), and data output pin (SOUT) also function as port P4, data input pin (SIN) also functions as port P2.

Bit 3 of the serial I/O mode register (address 00DC16) selects whether the synchronous clock is supplied internally or externally (from the SCLK pin). When an internal clock is selected, bits 1 and 0 select whether  $f(XIN)$  or  $f(XCIN)$  is divided by 4, 16, 32, or 64. To use SIN pin for serial I/O, set the corresponding bit of the port P2 direction register (address 00C516) to "0."

The operation of the serial I/O is described below. The operation of the serial I/O differs depending on the clock source; external clock or internal clock.

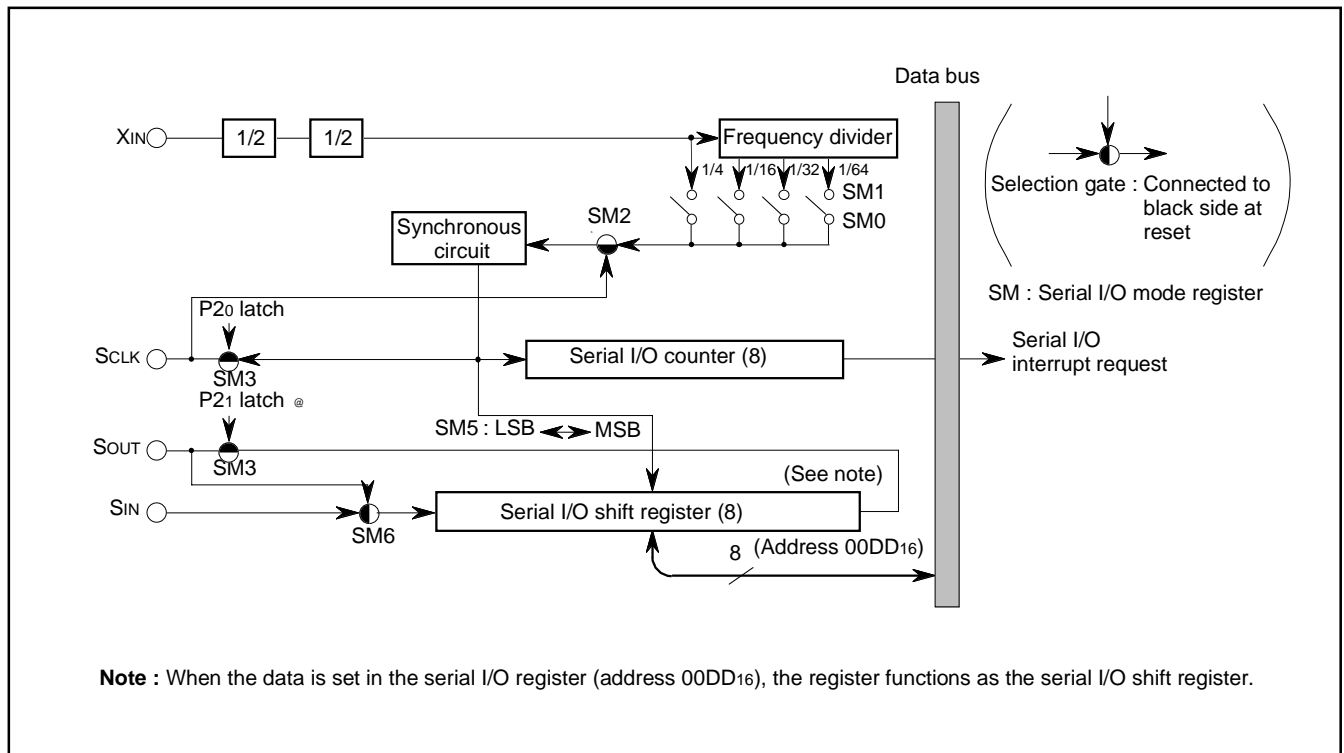

Fig. 8.5.1 Serial I/O Block Diagram

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

**Internal clock :** The serial I/O counter is set to "7" during the write cycle into the serial I/O register (address 00DD16), and the transfer clock goes HIGH forcibly. At each falling edge of the transfer clock after the write cycle, serial data is output from the SOUT pin. Transfer direction can be selected by bit 5 of the serial I/O mode register. At each rising edge of the transfer clock, data is input from the SIN pin and data in the serial I/O register is shifted 1 bit. After the transfer clock has counted 8 times, the serial I/O counter becomes "0" and the transfer clock stops at HIGH. At this time the interrupt request bit is set to "1."

**External clock :** The an external clock is selected as the clock source, the interrupt request is set to "1" after the transfer clock has been counted 8 counts. However, transfer operation does not stop, so the clock should be controlled externally. Use the external clock of 1 MHz or less with a duty cycle of 50%. The serial I/O timing is shown in Figure 8.5.2. When using an external clock for transfer, the external clock must be held at HIGH for initializing the serial I/O counter. When switching between an internal clock and an external clock, do not switch during transfer. Also, be sure to initialize the serial I/O counter after switching.

- Notes 1:** On programming, note that the serial I/O counter is set by writing to the serial I/O register with the bit managing instructions, such as SEB and CLB.
- 2:** When an external clock is used as the synchronous clock, write transmit data to the serial I/O register when the transfer clock input level is HIGH.

## 8.5.1 Serial I/O Common Transmission/Reception mode

By writing "1" to bit 6 of the serial I/O mode register, signals SIN and SOUT are switched internally to be able to transmit or receive the serial data.

Figure 8.5.4 shows signals on serial I/O common transmission/reception mode.

**Note:** When receiving the serial data after writing "FF16" to the serial I/O register.

## 8.6 MULTI-MASTER I<sup>2</sup>C-BUS INTERFACE

The multi-master I<sup>2</sup>C-BUS interface is a serial communications circuit, conforming to the Philips I<sup>2</sup>C-BUS data transfer format. This interface, offering both arbitration lost detection and a synchronous functions, is useful for the multi-master serial communications. Figure 8.6.1 shows a block diagram of the multi-master I<sup>2</sup>C-BUS interface and Table 8.6.1 shows multi-master I<sup>2</sup>C-BUS interface functions.

This multi-master I<sup>2</sup>C-BUS interface consists of the I<sup>2</sup>C address register, the I<sup>2</sup>C data shift register, the I<sup>2</sup>C clock control register, the I<sup>2</sup>C control register, the I<sup>2</sup>C status register and other control circuits.

Table 8.6.1 Multi-master I<sup>2</sup>C-BUS Interface Functions

Item	Function
Format	In conformity with Philips I <sup>2</sup> C-BUS standard: 10-bit addressing format 7-bit addressing format High-speed clock mode Standard clock mode
Communication mode	In conformity with Philips I <sup>2</sup> C-BUS standard: Master transmission Master reception Slave transmission Slave reception
SCL clock frequency	16.1 kHz to 400 kHz (at $\phi = 4$ MHz)

$\phi$  : System clock =  $f(XIN)/2$

**Note** : We are not responsible for any third party's infringement of patent rights or other rights attributable to the use of the control function (bits 6 and 7 of the I<sup>2</sup>C control register at address 00DA16) for connections between the I<sup>2</sup>C-BUS interface and ports (SCL1, SCL2, SDA1, SDA2).

Fig. 8.6.1 Block Diagram of Multi-master I<sup>2</sup>C-BUS Interface

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.6.1 I<sup>2</sup>C Data Shift Register

The I<sup>2</sup>C data shift register (S0 : address 00D7<sub>16</sub>) is an 8-bit shift register to store receive data and write transmit data.

When transmit data is written into this register, it is transferred to the outside from bit 7 in synchronization with the SCL clock, and each time one-bit data is output, the data of this register are shifted one bit to the left. When data is received, it is input to this register from bit 0 in synchronization with the SCL clock, and each time one-bit data is input, the data of this register are shifted one bit to the left.

The I<sup>2</sup>C data shift register is in a write enable status only when the ESO bit of the I<sup>2</sup>C control register (address 00DA<sub>16</sub>) is "1." The bit counter is reset by a write instruction to the I<sup>2</sup>C data shift register. When both the ESO bit and the MST bit of the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) are "1," the SCL is output by a write instruction to the I<sup>2</sup>C data shift register. Reading data from the I<sup>2</sup>C data shift register is always enabled regardless of the ESO bit value.

**Note:** To write data into the I<sup>2</sup>C data shift register after setting the MST bit to "0" (slave mode), keep an interval of 8 machine cycles or more.

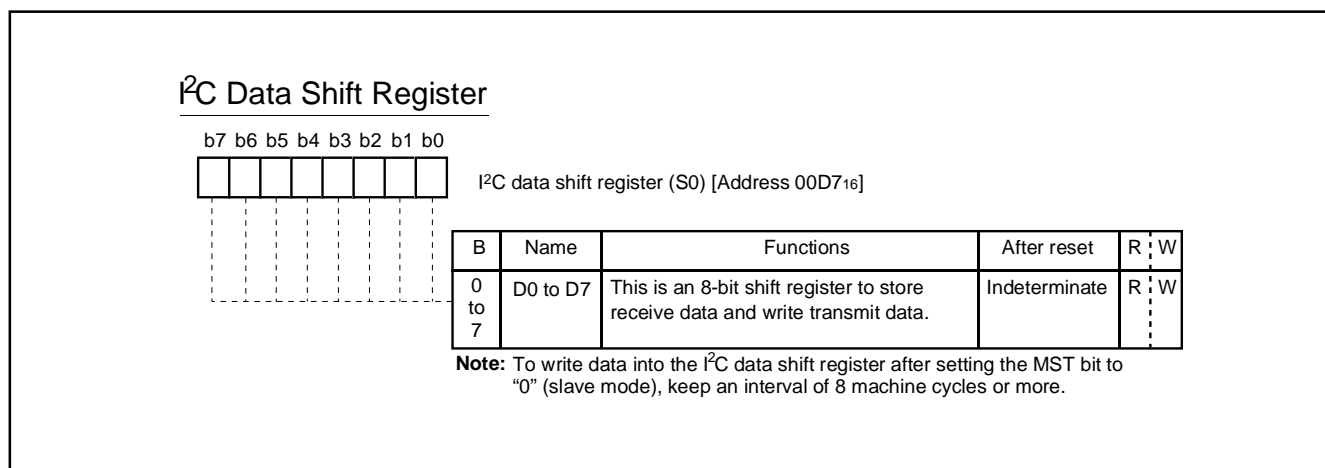

Fig. 8.6.2 Data Shift Register

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.6.2 I<sup>2</sup>C Address Register

The I<sup>2</sup>C address register (address 00D8<sub>16</sub>) consists of a 7-bit slave address and a read/write bit. In the addressing mode, the slave address written in this register is compared with the address data to be received immediately after the START condition are detected.

### (1) Bit 0: read/write bit (RBW)

Not used when comparing addresses, in the 7-bit addressing mode. In the 10-bit addressing mode, the first address data to be received is compared with the contents (SAD<sub>6</sub> to SAD<sub>0</sub> + RBW) of the I<sup>2</sup>C address register.

The RBW bit is cleared to "0" automatically when the stop condition is detected.

### (2) Bits 1 to 7: slave address (SAD<sub>0</sub>-SAD<sub>6</sub>)

These bits store slave addresses. Regardless of the 7-bit addressing mode and the 10-bit addressing mode, the address data transmitted from the master is compared with the contents of these bits.

Fig. 8.6.3 I<sup>2</sup>C Address Register

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.6.3 I<sup>2</sup>C Clock Control Register

The I<sup>2</sup>C clock control register (address 00DB16) is used to set ACK control, SCL mode and SCL frequency.

### (1) Bits 0 to 4: SCL frequency control bits (CCR0-CCR4)

These bits control the SCL frequency.

### (2) Bit 5: SCL mode specification bit (FAST MODE)

This bit specifies the SCL mode. When this bit is set to "0," the standard clock mode is set. When the bit is set to "1," the high-speed clock mode is set.

### (3) Bit 6: ACK bit (ACK BIT)

This bit sets the SDA status when an ACK clock\* is generated. When this bit is set to "0," the ACK return mode is set and SDA goes to LOW at the occurrence of an ACK clock. When the bit is set to "1," the ACK non-return mode is set. The SDA is held in the HIGH status at the occurrence of an ACK clock.

However, when the slave address matches the address data in the reception of address data at ACK BIT = "0," the SDA is automatically made LOW (ACK is returned). If there is a mismatch between the slave address and the address data, the SDA is automatically made HIGH (ACK is not returned).

### (4) Bit 7: ACK clock bit (ACK)

This bit specifies a mode of acknowledgment which is an acknowledgment response of data transmission. When this bit is set to "0," the no ACK clock mode is set. In this case, no ACK clock occurs after data transmission. When the bit is set to "1," the ACK clock mode is set and the master generates an ACK clock upon completion of each 1-byte data transmission. The device for transmitting address data and control data releases the SDA at the occurrence of an ACK clock (make SDA HIGH) and receives the ACK bit generated by the data receiving device.

**Note:** Do not write data into the I<sup>2</sup>C clock control register during transmission. If data is written during transmission, the I<sup>2</sup>C clock generator is reset, so that data cannot be transmitted normally.

\*ACK clock: Clock for acknowledgement

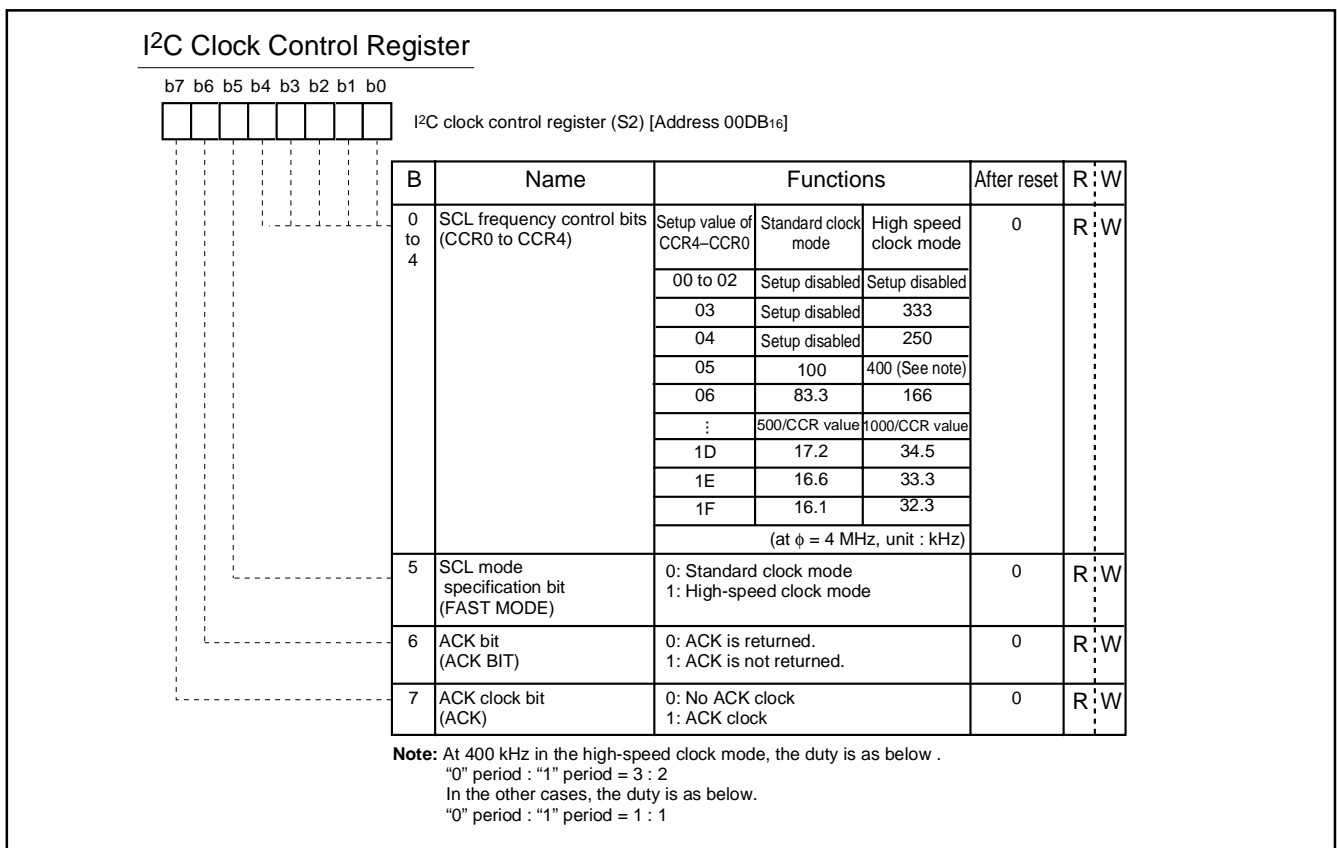

Fig. 8.6.4 I<sup>2</sup>C Address Register

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.6.4 I<sup>2</sup>C Control Register

The I<sup>2</sup>C control register (address 00DA16) controls the data communication format.

### (1) Bits 0 to 2: bit counter (BC0-BC2)

These bits decide the number of bits for the next 1-byte data to be transmitted. An interrupt request signal occurs immediately after the number of bits specified with these bits are transmitted. When a START condition is received, these bits become "0002" and the address data is always transmitted and received in 8 bits.

### (2) Bit 3: I<sup>2</sup>C interface use enable bit (ESO)

This bit enables usage of the multimaster I<sup>2</sup>C BUS interface. When this bit is set to "0," the use disable status is provided, so the SDA and the SCL become high-impedance. When the bit is set to "1," use of the interface is enabled.

When ESO = "0," the following is performed.

- PIN = "1," BB = "0" and AL = "0" are set (they are bits of the I<sup>2</sup>C status register at address 00D916).
- Writing data to the I<sup>2</sup>C data shift register (address 00D716) is disabled.

### (3) Bit 4: data format selection bit (ALS)

This bit decides whether or not to recognize slave addresses. When this bit is set to "0," the addressing format is selected, so that address data is recognized. When a match is found between a slave address and address data as a result of comparison or when a general call (refer to "8.6.5 I<sup>2</sup>C Status Register," bit 1) is received, transmission processing can be performed. When this bit is set to "1," the free data format is selected, so that slave addresses are not recognized.

### (4) Bit 5: addressing format selection bit (10BIT SAD)

This bit selects a slave address specification format. When this bit is set to "0," the 7-bit addressing format is selected. In this case, only the high-order 7 bits (slave address) of the I<sup>2</sup>C address register (address 00D816) are compared with address data. When this bit is set to "1," the 10-bit addressing format is selected, all the bits of the I<sup>2</sup>C address register are compared with address data.

### (5) Bits 6 and 7: connection control bits between I<sup>2</sup>C-BUS interface and ports (BSEL0, BSEL1)

These bits controls the connection between SCL and ports or SDA and ports (refer to Figure 8.6.5).

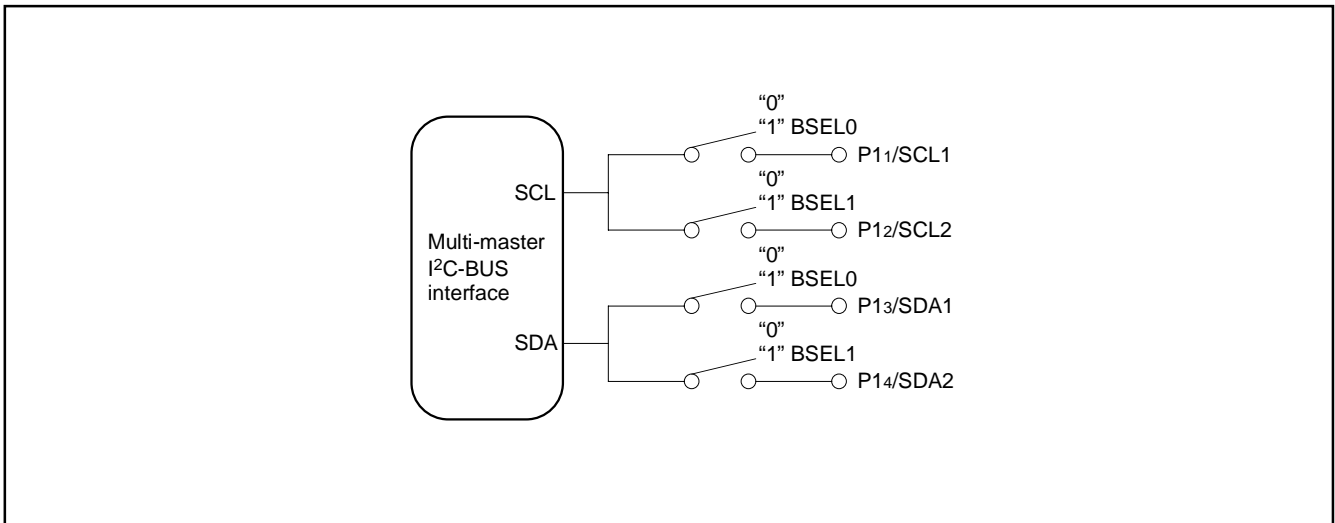

Fig. 8.6.5 Connection Port Control by BSEL0 and BSEL1

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.6.5 I<sup>2</sup>C Status Register

The I<sup>2</sup>C status register (address 00D916) controls the I<sup>2</sup>C-BUS interface status. The low-order 4 bits are read-only bits and the high-order 4 bits can be read out and written to.

### (1) Bit 0: last receive bit (LRB)

This bit stores the last bit value of received data and can also be used for ACK receive confirmation. If ACK is returned when an ACK clock occurs, the LRB bit is set to "0." If ACK is not returned, this bit is set to "1." Except in the ACK mode, the last bit value of received data is input. The state of this bit is changed from "1" to "0" by executing a write instruction to the I<sup>2</sup>C data shift register (address 00D716).

### (2) Bit 1: general call detecting flag (AD0)

This bit is set to "1" when a general call\* whose address data is all "0" is received in the slave mode. By a general call of the master device, every slave device receives control data after the general call. The AD0 bit is set to "0" by detecting the STOP condition or START condition.

\*General call: The master transmits the general call address "0016" to all slaves.

### (3) Bit 2: slave address comparison flag (AAS)

This flag indicates a comparison result of address data.

- In the slave receive mode, when the 7-bit addressing format is selected, this bit is set to "1" in one of the following conditions.
  - The address data immediately after occurrence of a START condition matches the slave address stored in the high-order 7 bits of the I<sup>2</sup>C address register (address 00D816).
  - A general call is received.
- In the slave reception mode, when the 10-bit addressing format is selected, this bit is set to "1" with the following condition.
  - When the address data is compared with the I<sup>2</sup>C address register (8 bits consists of slave address and RBW), the first bytes match.
- The state of this bit is changed from "1" to "0" by executing a write instruction to the I<sup>2</sup>C data shift register (address 00D716).

### (4) Bit 3: arbitration lost\* detecting flag (AL)

In the master transmission mode, when a device other than the microcomputer sets the SDA to "L," arbitration is judged to have been lost, so that this bit is set to "1." At the same time, the TRX bit is set to "0," so that immediately after transmission of the byte whose arbitration was lost is completed, the MST bit is set to "0." When arbitration is lost during slave address transmission, the TRX bit is set to "0" and the reception mode is set. Consequently, it becomes possible to receive and recognize its own slave address transmitted by another master device.

\*Arbitration lost: The status in which communication as a master is disabled.

### (5) Bit 4: I<sup>2</sup>C-BUS interface interrupt request bit (PIN)

This bit generates an interrupt request signal. Each time 1-byte data is transmitted, the state of the PIN bit changes from "1" to "0." At the same time, an interrupt request signal is sent to the CPU. The PIN bit is set to "0" in synchronization with a falling edge of the last clock (including the ACK clock) of an internal clock and an interrupt request signal occurs in synchronization with a falling edge of the PIN bit. When the PIN bit is "0," the SCL is kept in the "0" state and clock generation is disabled. Figure 8.6.8 shows an interrupt request signal generating timing chart.

The PIN bit is set to "1" in any one of the following conditions.

- Executing a write instruction to the I<sup>2</sup>C data shift register (address 00D716).
- When the ESO bit is "0"
- At reset

The conditions in which the PIN bit is set to "0" are shown below:

- Immediately after completion of 1-byte data transmission (including when arbitration lost is detected)
- Immediately after completion of 1-byte data reception
- In the slave reception mode, with ALS = "0" and immediately after completion of slave address or general call address reception
- In the slave reception mode, with ALS = "1" and immediately after completion of address data reception

### (6) Bit 5: bus busy flag (BB)

This bit indicates the status of use of the bus system. When this bit is set to "0," this bus system is not busy and a START condition can be generated. When this bit is set to "1," this bus system is busy and the occurrence of a START condition is disabled by the START condition duplication prevention function (See note).

This flag can be written by software only in the master transmission mode. In the other modes, this bit is set to "1" by detecting a START condition and set to "0" by detecting a STOP condition. When the ESO bit of the I<sup>2</sup>C control register (address 00DA16) is "0" and at reset, the BB flag is kept in the "0" state.

### (7) Bit 6: communication mode specification bit (transfer direction specification bit: TRX)

This bit decides the direction of transfer for data communication. When this bit is "0," the reception mode is selected and the data of a transmitting device is received. When the bit is "1," the transmission mode is selected and address data and control data are output into the SDA in synchronization with the clock generated on the SCL.

When the ALS bit of the I<sup>2</sup>C control register (address 00DA16) is "0" in the slave reception mode is selected, the TRX bit is set to "1" (transmit) if the least significant bit (R/W bit) of the address data transmitted by the master is "1." When the ALS bit is "0" and the R/W bit is "0," the TRX bit is cleared to "0" (receive).

The TRX bit is cleared to "0" in one of the following conditions.

- When arbitration lost is detected.
- When a STOP condition is detected.
- When occurrence of a START condition is disabled by the START condition duplication prevention function (Note).
- With MST = "0" and when a START condition is detected.
- With MST = "0" and when ACK non-return is detected.
- At reset

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## (8) Bit 7: Communication mode specification bit (master/slave specification bit: MST)

This bit is used for master/slave specification for data communication. When this bit is "0," the slave is specified, so that a START condition and a STOP condition generated by the master are received, and data communication is performed in synchronization with the clock generated by the master. When this bit is "1," the master is specified and a START condition and a STOP condition are generated, and also the clocks required for data communication are generated on the SCL.

The MST bit is cleared to "0" in one of the following conditions.

- Immediately after completion of 1-byte data transmission when arbitration lost is detected
- When a STOP condition is detected.
- When occurrence of a START condition is disabled by the START condition duplication preventing function (Note).
- At reset

**Note:** The START condition duplication prevention function disables the START condition generation, reset of bit counter reset, and SCL output, when the following condition is satisfied:  
a START condition is set by another master device.

Fig. 8.6.7 I2C Status Register

Fig. 8.6.8 Interrupt Request Signal Generation Timing

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### 8.6.6 START Condition Generation Method

When the ESO bit of the I<sup>2</sup>C control register (address 00DA<sub>16</sub>) is "1," execute a write instruction to the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) to set the MST, TRX and BB bits to "1." A START condition will then be generated. After that, the bit counter becomes "000<sub>2</sub>" and an SCL for 1 byte is output. The START condition generation timing and BB bit set timing are different in the standard clock mode and the high-speed clock mode. Refer to Figure 8.6.9 for the START condition generation timing diagram, and Table 8.6.2 for the START condition/STOP condition generation timing table.

Fig. 8.6.9 START Condition Generation Timing Diagram

### 8.6.7 STOP Condition Generation Method

When the ESO bit of the I<sup>2</sup>C control register (address 00DA<sub>16</sub>) is "1," execute a write instruction to the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) for setting the MST bit and the TRX bit to "1" and the BB bit to "0". A STOP condition will then be generated. The STOP condition generation timing and the BB flag reset timing are different in the standard clock mode and the high-speed clock mode. Refer to Figure 8.6.10 for the STOP condition generation timing diagram, and Table 8.6.2 for the START condition/STOP condition generation timing table.

Fig. 8.6.10 STOP Condition Generation Timing Diagram

Table 8.6.2 START Condition/STOP Condition Generation Timing Table

Item	Standard Clock Mode	High-speed Clock Mode
Setup time (START condition)	5.0 μs (20 cycles)	2.5 μs (10 cycles)
Setup time (STOP condition)	4.25 μs (17 cycles)	1.75 μs (7 cycles)
Hold time	5.0 μs (20 cycles)	2.5 μs (10 cycles)
Set/reset time for BB flag	3.0 μs (12 cycles)	1.5 μs (6 cycles)

Note: Absolute time at  $\phi = 4$  MHz. The value in parentheses denotes the number of  $\phi$  cycles.

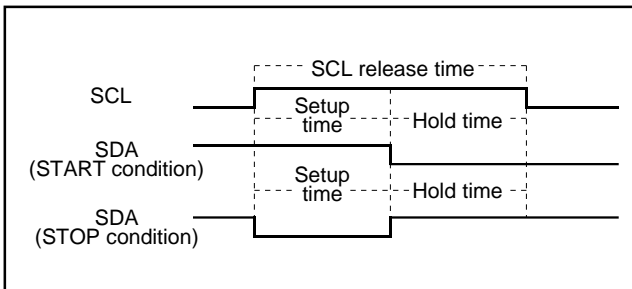

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.6.8 START/STOP Condition Detect Conditions

The START/STOP condition detect conditions are shown in Figure 8.6.11 and Table 8.6.3. Only when the 3 conditions of Table 8.6.3 are satisfied, a START/STOP condition can be detected.

**Note:** When a STOP condition is detected in the slave mode (MST = 0), an interrupt request signal "IICIRQ" is generated to the CPU.

**Fig. 8.6.11 START Condition/STOP Condition Detect Timing Diagram**

**Table 8.6.3 START Condition/STOP Condition Detect Conditions**

Standard Clock Mode	High-speed Clock Mode
6.5 μs (26 cycles) < SCL release time	1.0 μs (4 cycles) < SCL release time
3.25 μs (13 cycles) < Setup time	0.5 μs (2 cycles) < Setup time
3.25 μs (13 cycles) < Hold time	0.5 μs (2 cycles) < Hold time

**Note:** Absolute time at φ = 4 MHz. The value in parentheses denotes the number of φ cycles.

## 8.6.9 Address Data Communication

There are two address data communication formats, namely, 7-bit addressing format and 10-bit addressing format. The respective address communication formats is described below.

### (1) 7-bit addressing format

To meet the 7-bit addressing format, set the 10BIT SAD bit of the I<sup>2</sup>C control register (address 00DA16) to "0." The first 7-bit address data transmitted from the master is compared with the high-order 7-bit slave address stored in the I<sup>2</sup>C address register (address 00D816). At the time of this comparison, address comparison of the RBW bit of the I<sup>2</sup>C address register (address 00D816) is not made. For the data transmission format when the 7-bit addressing format is selected, refer to Figure 8.6.12, (1) and (2).

### (2) 10-bit addressing format

To meet the 10-bit addressing format, set the 10BIT SAD bit of the I<sup>2</sup>C control register (address 00DA16) to "1." An address comparison is made between the first-byte address data transmitted from the master and the 7-bit slave address stored in the I<sup>2</sup>C address register (address 00D816). At the time of this comparison, an address comparison between the RBW bit of the I<sup>2</sup>C address register (address 00D816) and the R/W bit which is the last bit of the address data transmitted from the master is made. In the 10-bit addressing mode, the R/W bit which is the last bit of the address data not only specifies the direction of communication for control data but also is processed as an address data bit.

When the first-byte address data matches the slave address, the AAS bit of the I<sup>2</sup>C status register (address 00D916) is set to "1." After the second-byte address data is stored into the I<sup>2</sup>C data shift register (address 00D716), make an address comparison between the second-byte data and the slave address by software. When the address data of the 2nd bytes matches the slave address, set the RBW bit of the I<sup>2</sup>C address register (address 00D816) to "1" by software. This processing can match the 7-bit slave address and R/W data, which are received after a RESTART condition is detected, with the value of the I<sup>2</sup>C address register (address 00D816). For the data transmission format when the 10-bit addressing format is selected, refer to Figure 8.6.12, (3) and (4).

## 8.6.10 Example of Master Transmission

An example of master transmission in the standard clock mode, at the SCL frequency of 100 kHz and in the ACK return mode is shown below.

- ① Set a slave address in the high-order 7 bits of the I<sup>2</sup>C address register (address 00D8<sub>16</sub>) and "0" in the RBW bit.
- ② Set the ACK return mode and SCL = 100 kHz by setting "85<sub>16</sub>" in the I<sup>2</sup>C clock control register (address 00DB<sub>16</sub>).
- ③ Set "10<sub>16</sub>" in the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) and hold the SCL at the HIGH.
- ④ Set a communication enable status by setting "48<sub>16</sub>" in the I<sup>2</sup>C control register (address 00DA<sub>16</sub>).
- ⑤ Set the address data of the destination of transmission in the high-order 7 bits of the I<sup>2</sup>C data shift register (address 00D7<sub>16</sub>) and set "0" in the least significant bit.
- ⑥ Set "F0<sub>16</sub>" in the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) to generate a START condition. At this time, an SCL for 1 byte and an ACK clock automatically occurs.
- ⑦ Set transmit data in the I<sup>2</sup>C data shift register (address 00D7<sub>16</sub>). At this time, an SCL and an ACK clock automatically occurs.
- ⑧ When transmitting control data of more than 1 byte, repeat step ⑦.
- ⑨ Set "D0<sub>16</sub>" in the I<sup>2</sup>C status register (address 00D9<sub>16</sub>). After this, if ACK is not returned or transmission ends, a STOP condition will be generated.

## 8.6.11 Example of Slave Reception

An example of slave reception in the high-speed clock mode, at the SCL frequency of 400 kHz, in the ACK non-return mode, using the addressing format, is shown below.

- ① Set a slave address in the high-order 7 bits of the I<sup>2</sup>C address register (address 00D8<sub>16</sub>) and "0" in the RBW bit.
- ② Set the no ACK clock mode and SCL = 400 kHz by setting "25<sub>16</sub>" in the I<sup>2</sup>C clock control register (address 00DB<sub>16</sub>).
- ③ Set "10<sub>16</sub>" in the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) and hold the SCL at the HIGH.
- ④ Set a communication enable status by setting "48<sub>16</sub>" in the I<sup>2</sup>C control register (address 00DA<sub>16</sub>).
- ⑤ When a START condition is received, an address comparison is made.
- ⑥ •When all transmitted address are "0" (general call):  
AD0 of the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) is set to "1" and an interrupt request signal occurs.  
•When the transmitted addresses match the address set in ①:  
ASS of the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) is set to "1" and an interrupt request signal occurs.  
•In the cases other than the above:  
AD0 and AAS of the I<sup>2</sup>C status register (address 00D9<sub>16</sub>) are set to "0" and no interrupt request signal occurs.
- ⑦ Set dummy data in the I<sup>2</sup>C data shift register (address 00D7<sub>16</sub>).
- ⑧ When receiving control data of more than 1 byte, repeat step ⑦.
- ⑨ When a STOP condition is detected, the communication ends.

## 8.6.12 Precautions when using multi-master I<sup>2</sup>C-BUS interface

### (1) Read-modify-write instruction

The precautions when the read-modify-write instruction such as SEB, CLB etc. is executed for each register of the multi-master I<sup>2</sup>C-BUS interface are described below.

- I<sup>2</sup>C data shift register (S0)  
When executing the read-modify-write instruction for this register during transfer, data may become a value not intended.
- I<sup>2</sup>C address register (S0D)  
When the read-modify-write instruction is executed for this register at detecting the STOP condition, data may become a value not intended. It is because hardware changes the read/write bit (RBW) at the above timing.
- I<sup>2</sup>C status register (S1)  
Do not execute the read-modify-write instruction for this register because all bits of this register are changed by hardware.
- I<sup>2</sup>C control register (S1D)  
When the read-modify-write instruction is executed for this register at detecting the START condition or at completing the byte transfer, data may become a value not intended. Because hardware changes the bit counter (BC0-BC2) at the above timing.
- I<sup>2</sup>C clock control register (S2)  
The read-modify-write instruction can be executed for this register.

### (2) START condition generating procedure using multi-master

① Procedure example (The necessary conditions of the generating procedure are described as the following ② to ⑤).

```

•
•
LDA    —          (Taking out of slave address value)
SEI    (Interrupt disabled)
BBS    5,S1,BUSBUSY (BB flag confirming and branch process)
BUSFREE:
STA    S0          (Writing of slave address value)
LDM    #$F0, S1   (Trigger of START condition generating)
CLI    (Interrupt enabled)
•
•
BUSBUSY:
CLI    (Interrupt enabled)
•
•

```

- ② Use "STA," "STX" or "STY" of the zero page addressing instruction for writing the slave address value to the I<sup>2</sup>C data shift register.
- ③ Use "LDM" instruction for setting trigger of START condition generating.
- ④ Write the slave address value of above ② and set trigger of START condition generating of above ③ continuously shown the above procedure example.
- ⑤ Disable interrupts during the following three process steps:
  - BB flag confirming
  - Writing of slave address value
  - Trigger of START condition generating
 When the condition of the BB flag is bus busy, enable interrupts immediately.

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### (3) RESTART condition generating procedure

① Procedure example (The necessary conditions of the generating procedure are described as the following ② to ⑥.)

Execute the following procedure when the PIN bit is "0."

```

      •
      •
LDM  #$00, S1    (Select slave receive mode)
LDA  —          (Taking out of slave address value)
SEI  —          (Interrupt disabled)
STA  S0         (Writing of slave address value)
LDM  #$F0, S1   (Trigger of RESTART condition generating)
CLI  —          (Interrupt enabled)
      •
      •
    
```

② Select the slave receive mode when the PIN bit is "0." Do not write "1" to the PIN bit. Neither "0" nor "1" is specified for the writing to the BB bit.

The TRX bit becomes "0" and the SDA pin is released.

③ The SCL pin is released by writing the slave address value to the I<sup>2</sup>C data shift register. Use "STA," "STX" or "STY" of the zero page addressing instruction for writing.

④ Use "LDM" instruction for setting trigger of RESTART condition generating.

⑤ Write the slave address value of above ③ and set trigger of RESTART condition generating of above ④ continuously shown the above procedure example.

⑥ Disable interrupts during the following two process steps:

- Writing of slave address value
- Trigger of RESTART condition generating

### (4) STOP condition generating procedure

① Procedure example (The necessary conditions of the generating procedure are described as the following ② to ④.)

```

      •
      •
SEI  —          (Interrupt disabled)
LDM  #$C0, S1   (Select master transmit mode)
NOP  —          (Set NOP)
LDM  #$D0, S1   (Trigger of STOP condition generating)
CLI  —          (Interrupt enabled)
      •
      •
    
```

② Write "0" to the PIN bit when master transmit mode is select.

③ Execute "NOP" instruction after setting of master transmit mode. Also, set trigger of STOP condition generating within 10 cycles after selecting of master transmit mode.

④ Disable interrupts during the following two process steps:

- Select of master transmit mode
- Trigger of STOP condition generating

### (5) Writing to I<sup>2</sup>C status register

Do not execute an instruction to set the PIN bit to "1" from "0" and an instruction to set the MST and TRX bits to "0" from "1" simultaneously. It is because it may enter the state that the SCL pin is released and the SDA pin is released after about one machine cycle. Do not execute an instruction to set the MST and TRX bits to "0" from "1" simultaneously when the PIN bit is "1." It is because it may become the same as above.

### (6) Process of after STOP condition generating

Do not write data in the I<sup>2</sup>C data shift register S0 and the I<sup>2</sup>C status register S1 until the bus busy flag BB becomes "0" after generating the STOP condition in the master mode. It is because the STOP condition waveform might not be normally generated. Reading to the above registers do not have the problem.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.7 PWM OUTPUT FUNCTION

This microcomputer is equipped with two 14-bit PWMs (DA1, DA2) and six 8-bit PWMs (PWM0-PWM5). DA1 and DA2 have a 14-bit resolution with the minimum resolution bit width of 0.25  $\mu$ s and a repeat period of 4096  $\mu$ s (for  $f(X_{IN}) = 8$  MHz). PWM0-PWM5 have the same circuit structure and an 8-bit resolution with minimum resolution bit width of 4  $\mu$ s and repeat period of 1024  $\mu$ s (for  $f(X_{IN}) = 8$  MHz).

Figure 8.7.1 shows the PWM block diagram. The PWM timing generating circuit applies individual control signals to DA1, DA2 and PWM0-PWM5 using  $f(X_{IN})$  divided by 2 as a reference signal.

### 8.7.1 Data Setting

When outputting DA1, first set the high-order 8 bits to the DA1-H register (address 00CE<sub>16</sub>), then the low-order 6 bits to the DA1-L register (address 00CF<sub>16</sub>). When outputting DA2, first set the high-order 8 bits to the DA2-H register (address 024E<sub>16</sub>), then the low-order 6 bits to the DA2-L register (address 024F<sub>16</sub>). When outputting PWM0-PWM5, set 8-bit output data to the PWM<sub>i</sub> register (i means 0 to 5; addresses 00D0<sub>16</sub> to 00D4<sub>16</sub>, 00F6<sub>16</sub>).

### 8.7.2 Transferring Data from Registers to PWM Circuit

Data transfer from the 8-bit PWM register to the 8-bit PWM circuit is executed at writing data to the register.

The signal output from the 8-bit PWM output pin corresponds to the contents of this register.

Also, data transfer from the DA1 register (addresses 00CE<sub>16</sub> and 00CF<sub>16</sub>) to the 14-bit PWM circuit is executed at writing data to the DA1-L register (address 00CF<sub>16</sub>). Reading from the DA1-H register (address 00CE<sub>16</sub>) means reading this transferred data. Data transfer from the DA2 register (addresses 024E<sub>16</sub> and 024F<sub>16</sub>) to the 14-bit PWM circuit is executed at writing data to the DA2-L register (address 024F<sub>16</sub>). Reading from the DA2-H register (address 024E<sub>16</sub>) means reading this transferred data. Accordingly, it is possible to confirm the data being output from the DA<sub>i</sub> (i = 1, 2) output pin by reading the DA<sub>i</sub> (i = 1, 2) register.

### 8.7.3 Operating of 8-bit PWM

The following explains PWM operation.

First, set the bit 0 of PWM output control register 1 (address 00D5<sub>16</sub>) to "0" (at reset, bit 0 is already set to "0" automatically), so that the PWM count source is supplied.

PWM0-PWM5 are also used as pins P00-P05, respectively. For PWM0-PWM5, set the corresponding bits of the ports P0 direction register to "1" (output mode). And select each output polarity by bit 3 of PWM output control register 2 (address 00D6<sub>16</sub>). Then, set bits 2 to 7 of PWM output control register 1 to "1" (PWM output).

The PWM waveform is output from the PWM output pins by setting these registers.

Figure 8.7.2 shows the 8-bit PWM timing. One cycle (T) is composed of 256 (2<sup>8</sup>) segments. The 8 kinds of pulses, relative to the weight of each bit (bits 0 to 7), are output inside the circuit during 1 cycle. Refer to Figure 8.7.2 (a). The 8-bit PWM outputs waveform which is the logical sum (OR) of pulses corresponding to the contents of bits 0 to 7 of the 8-bit PWM register. Several examples are

shown in Figure 8.7.2 (b). 256 kinds of output (HIGH area: 0/256 to 255/256) are selected by changing the contents of the PWM register. A length of entirely HIGH output cannot be output, i.e. 256/256.

### 8.7.4 Operating of 14-bit PWM

For DA1, as with 8-bit PWM, set the bit 0 of PWM output control register 1 (address 00D5<sub>16</sub>) to "0" (at reset, bit 0 is already set to "0" automatically), so that the PWM count source is supplied. Next, select the output polarity by bit 2 of PWM output control register 2 (address 00D6<sub>16</sub>). Then, the 14-bit PWM outputs from the DA1 output pin by setting bit 1 of PWM output control register 1 to "0" (at reset, this bit already set to "0" automatically) to select the DA1 output.

For DA2 as with DA1, set the bit 0 of PWM output control register 1 (address 00D5<sub>16</sub>) to "0" (at reset, bit 0 is already set to "0" automatically), so that PWM count source is supplied. Next, select the output polarity by bit 4 of PWM output control register 2 (address 00D6<sub>16</sub>). Then, the 14-bit PWM outputs from the DA2 output pin by setting bit 5 of PWM output control register 1 to "0" (at reset, this bit already set to "0" automatically) to select the DA2 output.

The output example of the 14-bit PWM is shown in Figure 8.7.3.

The 14-bit PWM divides the data of the DA<sub>i</sub> latch (i = 1, 2) into the low-order 6 bits and the high-order 8 bits.

The fundamental waveform is determined with the high-order 8-bit data "DH." A HIGH area with a length t × DH (HIGH area of fundamental waveform) is output every short area of "t" = 256τ = 64  $\mu$ s (τ is the minimum resolution bit width of 250 ns). The HIGH level area increase interval (tm) is determined with the low-order 6-bit data "DL." The HIGH are of smaller intervals "tm" shown in Table 5 is longer by t than that of other smaller intervals in PWM repeat period "T" = 64t. Thus, a rectangular waveform with the different HIGH width is output from the DA<sub>i</sub> pins (i = 1, 2). Accordingly, the PWM output changes by τ unit pulse width by changing the contents of the DA<sub>i</sub>-H and DA<sub>i</sub>-L registers (i = 1, 2). A length of entirely HIGH cannot be output, i. e. 256/256.

### 8.7.5 Output after Reset

At reset, the output of ports P00-P05 and P17 are in the high-impedance state, and the contents of the PWM register and the PWM circuit are undefined. Note that after reset, the PWM output is undefined until setting the PWM register.

**Table 8.7.1 Relation Between the Low-order 6-bit Data and High-level Area Increase Interval**

Low-order 6 bits of Data	Area Longer by τ than That of Other tm (m = 0 to 63)

## 8.8 A-D CONVERTER

### 8.8.1 A-D Conversion Register (AD)

A-D conversion register is a read-only register that stores the result of an A-D conversion. This register should not be read during A-D conversion.

### 8.8.2 A-D Control Register (ADCON)

The A-D control register controls A-D conversion. Bits 2 to 0 of this register select analog input pins. When these pins are not used as analog input pins, they are used as ordinary I/O pins. Bit 3 is the A-D conversion completion bit, A-D conversion is started by writing "0" to this bit. The value of this bit remains at "0" during an A-D conversion, then changes to "1" when the A-D conversion is completed.

Bit 4 controls connection between the resistor ladder and Vcc. When not using the A-D converter, the resistor ladder can be cut off from the internal Vcc by setting this bit to "0," accordingly providing low-power dissipation.

### 8.8.3 Comparison Voltage Generator (Resistor Ladder)

The voltage generator divides the voltage between Vss and Vcc by 256, and outputs the divided voltages to the comparator as the reference voltage  $V_{ref}$ .

### 8.8.4 Channel Selector

The channel selector connects an analog input pin, selected by bits 2 to 0 of the A-D control register, to the comparator.

### 8.8.5 Comparator and Control Circuit

The conversion result of the analog input voltage and the reference voltage " $V_{ref}$ " is stored in the A-D conversion register. The A-D conversion completion bit and A-D conversion interrupt request bit are set to "1" at the completion of A-D conversion.

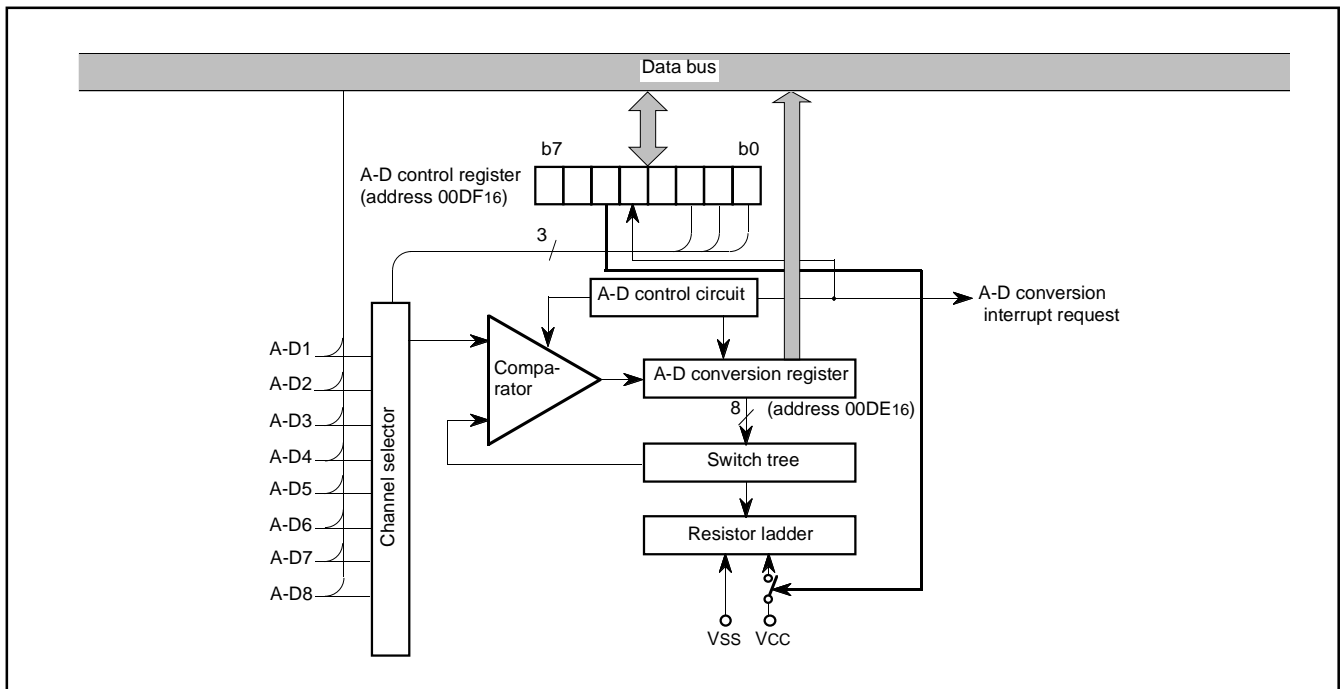

Fig. 8.8.1 A-D Converter Block Diagram

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### 8.8.6 Conversion Method

- ① Set the A-D conversion interrupt request bit to "0" (even when A-D conversion is started, the A-D conversion interrupt request bit is not set to "0" automatically).
- ② When using A-D conversion interrupt, enable interrupts by setting A-D conversion interrupt enable bit to "1" and setting the interrupt disable flag to "0."
- ③ Set the Vcc connection selection bit to "1" to connect Vcc to the resistor ladder.
- √ Select analog input pins by the analog input selection bit of the A-D control register.
- ⑤ Set the A-D conversion completion bit to "0." This write operation starts the A-D conversion. Do not read the A-D conversion register during the A-D conversion.
- ≈ Verify the completion of the conversion by the state ("1") of the A-D conversion completion bit, the state ("1") of A-D conversion interrupt request bit, or the occurrence of an A-D conversion interrupt.
- △ Read the A-D conversion register to obtain the conversion results.

**Note :** When the ladder resistor is disconnect from Vcc, set the Vcc connection selection bit to "0" between steps ≈ and △.

### 8.8.7 Internal Operation

When the A-D conversion starts, the following operations are automatically performed.

- ① The A-D conversion register is set to "0016."
- ② The most significant bit of the A-D conversion register becomes "1," and the comparison voltage "Vref" is input to the comparator. At this point, Vref is compared with the analog input voltage "VIN."
- ③ Bit 7 is determined by the comparison results as follows.  
When  $V_{ref} < V_{IN}$  : bit 7 holds "1"  
When  $V_{ref} > V_{IN}$  : bit 7 becomes "0"

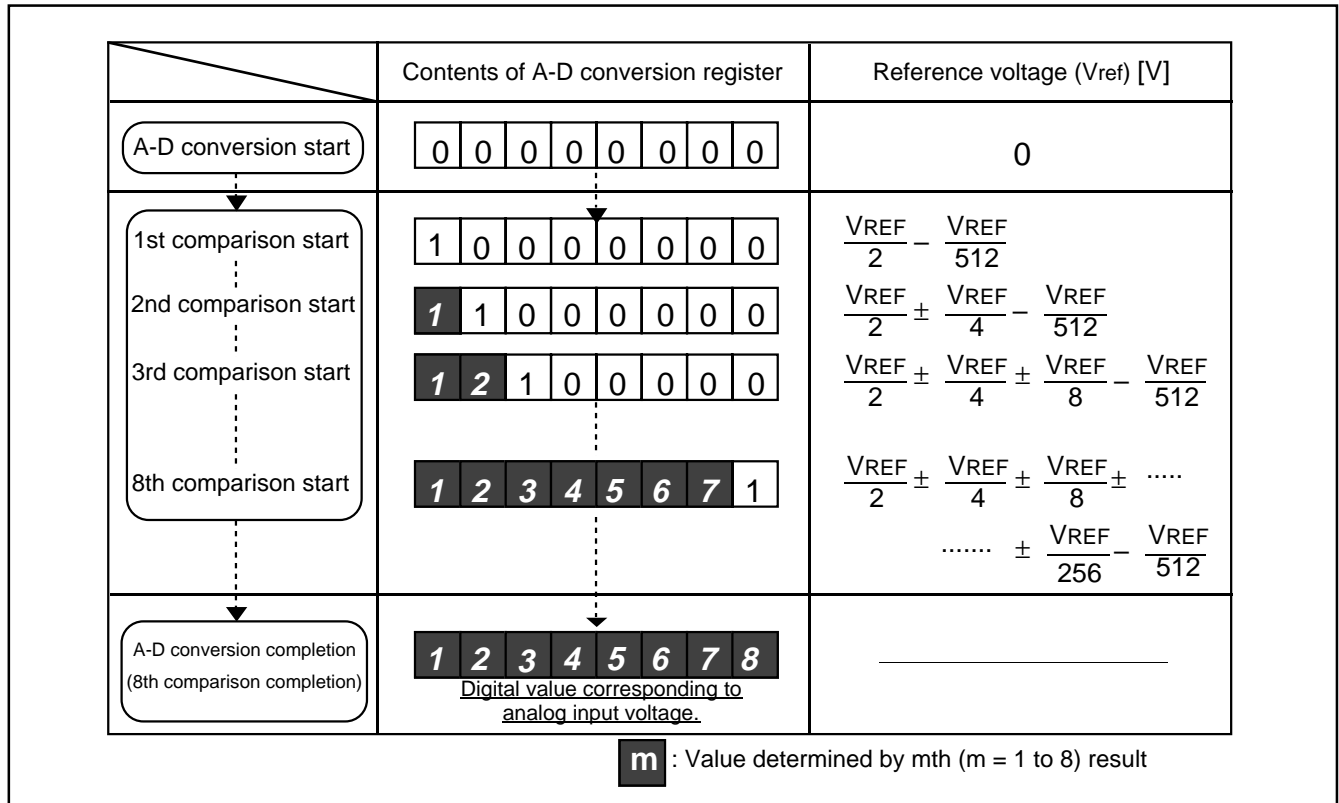

With the above operations, the analog value is converted into a digital value. The A-D conversion terminates in a maximum of 50 machine cycles (8.5 μs at  $f(XIN) = 8$  MHz) after it starts, and the conversion result is stored in the A-D conversion register.

An A-D conversion interrupt request occurs at the same time as A-D conversion completion, the A-D conversion interrupt request bit becomes "1." The A-D conversion completion bit also becomes "1."

**Table 8.8.1 Expression for Vref and VREF**

A-D conversion register contents "n" (decimal notation)	Vref (V)
0	0
1 to 255	$\frac{V_{REF}}{256} \sim (n \mid 0.5)$

**Note:** VREF indicates the reference voltage (= Vcc).

**Fig. 8.8.3 Changes in A-D Conversion Register and Comparison Voltage during A-D Conversion**

with ON-SCREEN DISPLAY CONTROLLER

## 8.8.8 Definition of A-D Conversion Accuracy

The definition of A-D conversion accuracy is described below (refer to Figure 8.8.4).

### (1) Relative Accuracy

#### • Zero transition error (V<sub>0T</sub>)

The deviation of the input voltage at which A-D conversion output data changes from "0" to "1," from the corresponding ideal A-D conversion characteristics between 0 and V<sub>REF</sub>.

$$V_{0T} = \frac{(V_0 - 1/2 \times V_{REF}/256)}{1\text{LSB}} \quad [\text{LSB}]$$

#### • Full-scale transition error (V<sub>FST</sub>)

The deviation of the input voltage at which A-D conversion output data changes from "255" to "254," from the corresponding ideal A-D conversion characteristics between 0 and V<sub>REF</sub>.

$$V_{FST} = \frac{(V_{REF} - 3/2 \times V_{REF}/256) - V_{254}}{1\text{LSB}} \quad [\text{LSB}]$$

#### • Non-linearity error

The deviation of the actual A-D conversion characteristics, from the ideal A-D conversion characteristics between V<sub>0</sub> and V<sub>254</sub>.

$$\text{Non-linearity error} = \frac{V_n - (1\text{LSB} \times n + V_0)}{1\text{LSB}} \quad [\text{LSB}]$$

#### • Differential non-linearity error

The deviation of the input voltage required to change output data by "1," from the corresponding ideal A-D conversion characteristics between 0 and V<sub>REF</sub>.

$$\text{Differential non-linearity error} = \frac{(V_{n+1} - V_n) - 1\text{LSB}}{1\text{LSB}} [\text{LSB}]$$

### (2) Absolute Accuracy

#### • Absolute accuracy error

The deviation of the actual A-D conversion characteristics, from the ideal A-D conversion characteristics between 0 and V<sub>REF</sub>.

$$\text{Absolute accuracy error} = \frac{V_n - 1\text{LSBA} \times (n + 1/2)}{1\text{LSBA}} \quad [\text{LSB}]$$

**Note:** The analog input voltage "V<sub>n</sub>" at which A-D conversion output data changes from "n" to "n + 1" (n ; 0 to 254) is as follows (refer to Figure 8.8.4) :

$$1\text{LSB with respect to relative accuracy} = \frac{V_{254} - V_0}{254} \quad [\text{V}]$$

$$1\text{LSBA with respect to absolute accuracy} = \frac{V_{REF}}{256} \quad [\text{V}]$$

Fig. 8.8.4 Definition of A-D Conversion Accuracy

## 8.9 ROM CORRECTION FUNCTION

This can correct program data in ROM. Up to 3 addresses can be corrected, a program for correction is stored in the ROM correction vector in RAM as the top address. The ROM correction vectors are 3 vectors.

- Vector 1 : address 02C0<sub>16</sub>
- Vector 2 : address 02E0<sub>16</sub>
- Vector 3 : address 0300<sub>16</sub>

Set the address of the ROM data to be corrected into the ROM correction address register. When the value of the counter matches the ROM data address in the ROM correction vector as the top address, the main program branches to the correction program stored in the ROM memory for correction. To return from the correction program to the main program, the op code and operand of the JMP instruction (total of 3 bytes) are necessary at the end of the correction program. The ROM correction function is controlled by the ROM correction enable register.

- Notes 1:** Specify the first address (op code address) of each instruction as the ROM correction address.  
**2:** Use the JMP instruction (total of 3 bytes) to return from the correction program to the main program.  
**3:** Do not set the same ROM correction address to vectors 1 to 3.

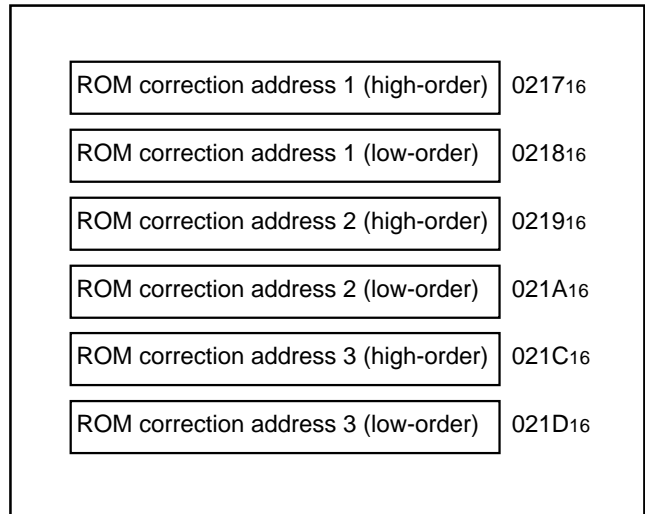

Fig. 8.9.1 ROM Correction Address Registers

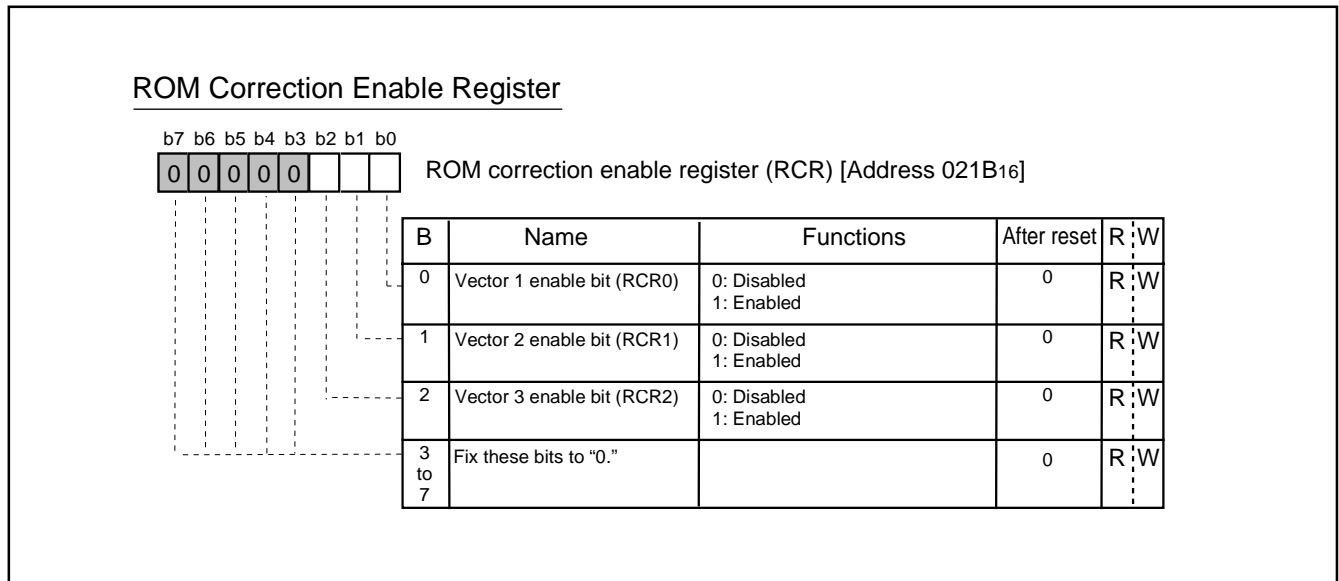

Fig. 8.9.2 ROM Correction Enable Register

## 8.10 OSD FUNCTIONS

This OSD function can display the following 3 types:

- "Block display" (24 characters X 2 lines)
- "SPRITE display" (display only a character) or "Raster patterning display" (display a character on entire screen side by side)
- "Raster flat display" (coloring entire screen)

The above displays can be overlapped at the same time. The priority is :

SPRITE display > Block display > Raster flat display

or

Block display > Raster patterning display > Raster flat display

Note that raster patterning display and SPRITE display cannot be used simultaneously.

Figure 8.10.2 shows the block diagram of OSD circuit, Figure 8.10.3 shows the configuration of OSD character display area, Figure 8.10.4 shows the OSD control register.

## (1) Clock for OSD

As a clock for display to be used for OSD, it is possible to select one of the following 3 types.

- Main clock from the pins XIN and XOUT
- Clock from the LC or RC oscillator supplied from the pins OSC1 and OSC2 and OSC2
- Clock from the ceramic resonator or the quartz-crystal oscillator from the pins OSC1 and OSC2

The clock for display to be used for OSD can be selected by bits 0 and 1 of the interrupt input polarity register (address 00CD16).

And besides, when selecting main clock, set the oscillation frequency to 8 MHz.

Fig. 8.10.5 Interrupt Input Polarity Register

**M37225M6-XXXSP, M37225M8-XXXSP  
M37225ECSP**

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

**(2) Scan mode**

This microcomputer has the bi-scan mode for corresponding to HSYNC of double-speed frequency. In the bi-scan mode, the vertical start display position and the vertical dot size is two times as compared with the normal scan mode. The scan mode is selected by bit 5 of the OSD control register (refer to Figure 8.10.3).

**Table 8.10.1 Setting for Scan Mode**

Parameter	Scan Mode	Normal Scan	Bi-Scan
Bit 5 of OSD Control Register		0	1
Vertical Display Start Position		Value of vertical position register X 1H	Value of vertical position register X 2H
Vertical Dot Size		1Tosc X 1H 2Tosc X 2H 3Tosc X 3H	1Tosc X 2H 2Tosc X 4H 3Tosc X 6H

**Notes** 1: TOSC = OSD oscillation cycle  
2: H = HSYNC

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### (3) OSD input/output pin control

The OSD output pins R, G, B, OUT1 and OUT2 can also function as ports P52, P53, P54, P55, P10 respectively. Switch either OSD output function or port function by the OSD port control register (address 00CB16).

The input polarity of the Hsync, Vsync and output polarity of signals R, G, B, OUT1 and OUT2 can be specified with the OSD I/O polarity register (address 00EB16). Set a bit to "0" to specify positive polarity;

set it to "1" to specify negative polarity.

Figure 8.10.6 shows the OSD I/O polarity register and Figure 8.10.7 shows the OSD port control register.

Fig. 8.10.6 OSD I/O Polarity Register

with ON-SCREEN DISPLAY CONTROLLER

## 8.10.1 Block Display

There are 2 display modes and they are selected by a block unit. The display modes are selected by bits 0 to 2 of block i control register (i = 1, 2).

The features of each mode are described below.

There are an extended display mode. This mode allows multiple lines (3 lines or more) to be displayed on the screen by interrupting the display each time one line is displayed and rewriting data in the block for which display is terminated by software.

**Table 8.10.2 Features of Each Display Style of Block Display**

Display style Parameter	Block display	
	OSD mode (On-screen display mode)	BUTTON mode (BUTTON display mode)
Number of display characters	24 characters X 2 lines	
Dot structure	16 X 20 dots	16 X 20 dots Character display area: (16 dots + 4 dots) X (20 dots + 4 dots)
Kinds of characters	381 kinds	
Kinds of character sizes	3 kinds	
Dot size	1Tosc X 1H, 2Tosc X 2H, 3Tosc X 3H (per block unit) (See notes 1, 2)	
Attribute	Border (per block unit)	<ul style="list-style-type: none"> <li>■ Border (per block unit)</li> <li>■ BUTTON display (per character unit)</li> <li>■ Block shadow display (per character unit)</li> </ul>
Character font coloring	1 screen: 8 kinds (per character unit)	
Character background coloring	1 screen: 8 kinds (per character unit)	
OSD output	R, G, B	
Raster coloring	Possible (per screen unit)	
Other functions	<ul style="list-style-type: none"> <li>■ Corresponding to bi-scan</li> <li>■ Window function (See note 3)</li> </ul>	
Display position	Horizontal: 64 levels, Vertical: 255 levels	
Display expansion (multiline display)	Possible	

**Notes 1:** TOSC = OSD oscillation cycle  
**2:** H = HSYNC  
**3:** The SPRITE display is not effected by the window function.

**Fig. 8.10.8 Block i Control Register (i = 1, 2)**

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## (1) Display position

The display positions of characters are specified by a block. There are 2 blocks, blocks 1 and 2. Up to 24 characters can be displayed in each block (refer to "(3) Memory for OSD").

The display position of each block can be set in both horizontal and vertical directions by software.

The display start position in the horizontal direction can be set for all blocks in common in 64-step display positions in units of 4TOSC (TOSC = OSD oscillation cycle).

The display start position in the vertical direction for each block can be set in 255-step display positions in units of 1 H (H = Hsync cycle).

Blocks are displayed in conformance with the following rules:

- When the display position of block 1 is overlapped with block 2 (Figure 8.10.9 (b)), block 1 is displayed on the front.
- When another block display position appears while one block is displayed (Figure 8.10.9 (c)), the block with a larger set value as the vertical display start position is displayed.

For the display position of SPRITE display, it is necessary to set independently, and it is possible to set display positions independently. Refer to "8.10.2 SPRITE Display."

Fig. 8.10.9 Display Position

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

The vertical display start position is determined by counting the horizontal sync signal (HSYNC). At this time, when VSYNC and HSYNC are positive polarity (negative polarity), it starts to count the rising edge (falling edge) of HSYNC signal from after fixed cycle of rising edge (falling edge) of VSYNC signal. So interval from rising edge (falling edge) of VSYNC signal to rising edge (falling edge) of HSYNC signal needs enough time (2 machine cycles or more) for avoiding jitter. The polarity of HSYNC and VSYNC signals can select with the OSD I/O polarity register (address 00EB16).

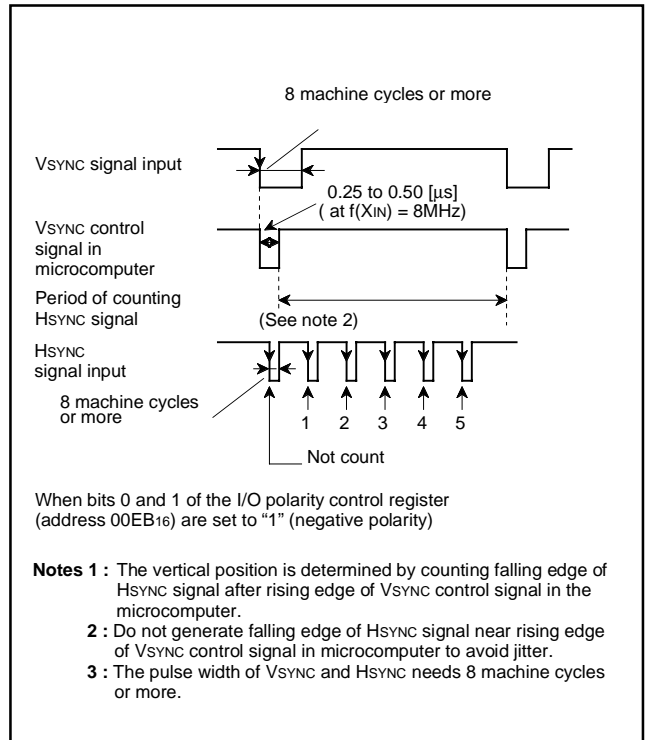

Fig. 8.10.10 Supplement Explanation for Display Position

The vertical display start position for each block can be set in 255 steps (where each step is 1H (H: HSYNC cycle)) as values "0116" to "FF16" in block i V register (i = 1, 2) (addresses 00E116 to 00E216). When setting the block i V register to "0116," the display is started at 18H of count value of HSYNC signal. The vertical display start position here indicates the top position of character display area in OSD/BUTTON mode.

The block i V register is shown in Figures 8.10.11.

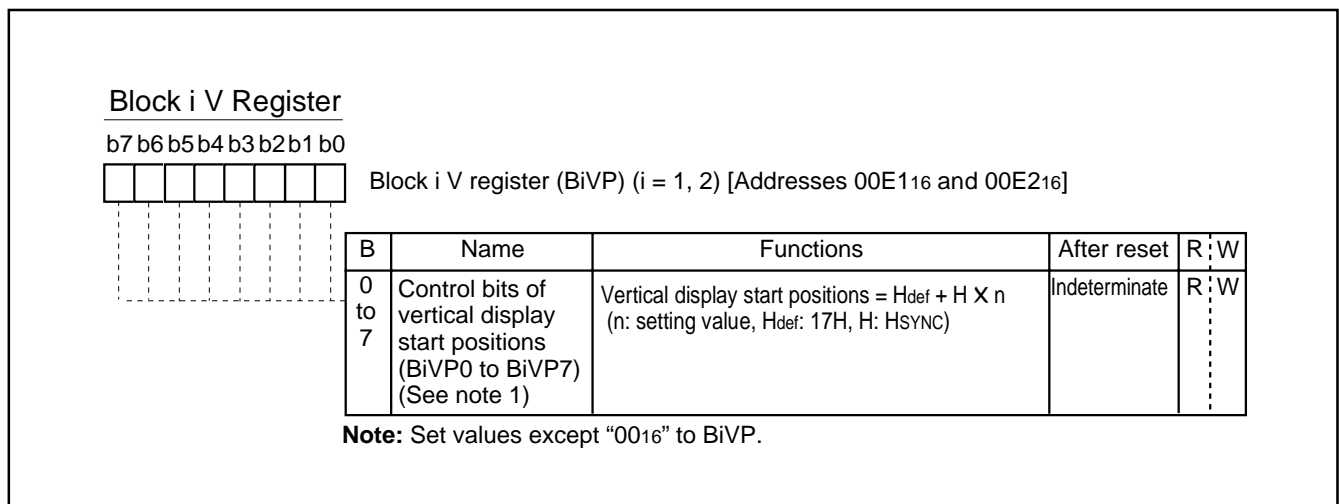

Fig. 8.10.11 Block i V Register (i = 1, 2)

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

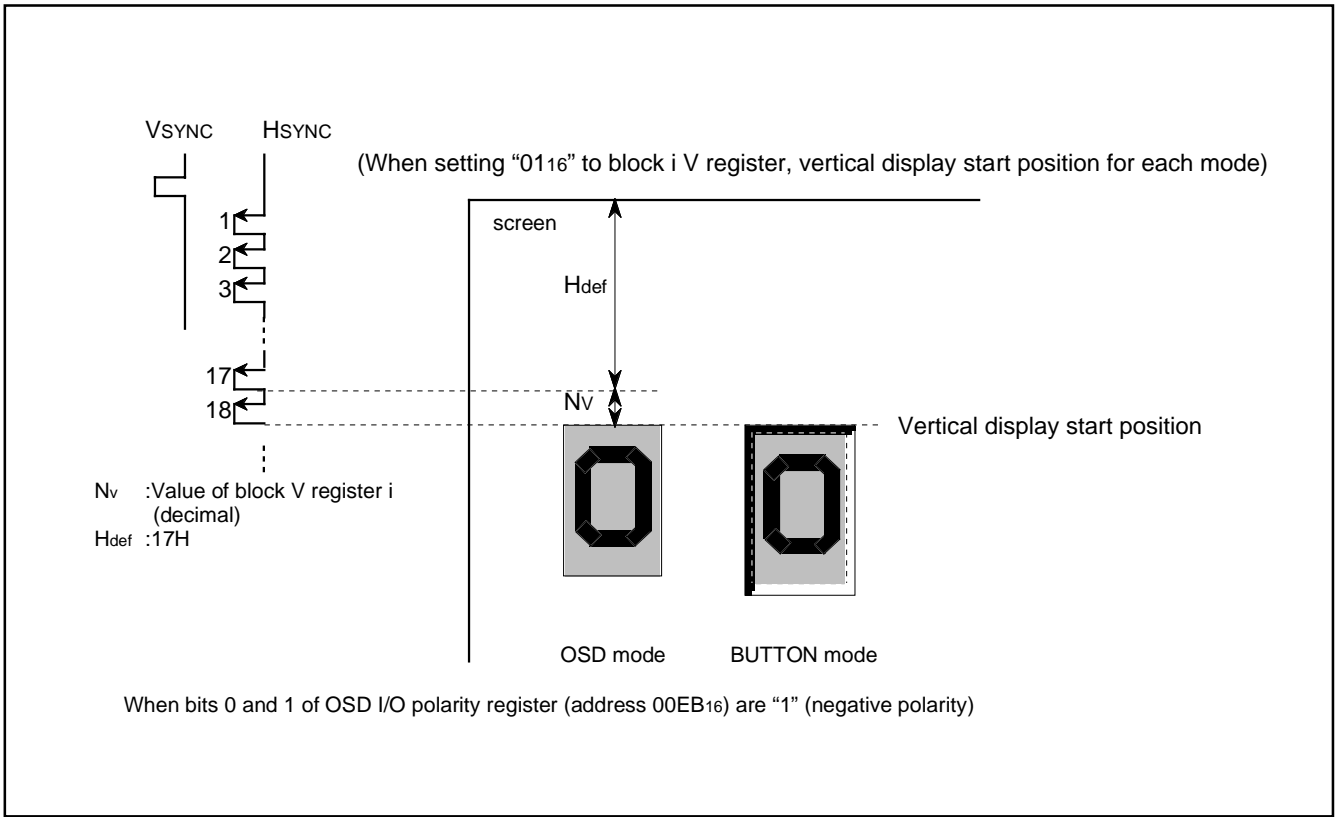

Fig. 8.10.12 Notes on Vertical Display Start Position

The horizontal display start position is common to all blocks, and can be set in 64 steps (where 1 step is 4Tosc, TOSC being the OSD oscillation cycle) as values "0016" to "3F16" in the block H register (address 00E016). The block H register is shown in Figure 8.10.13.

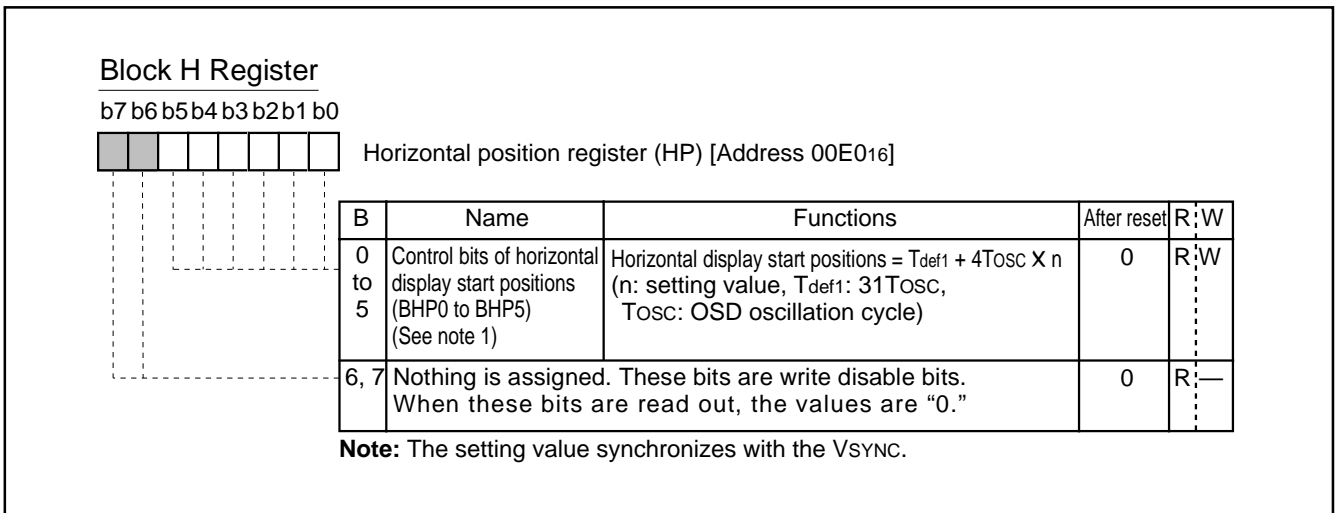

Fig. 8.10.13 Block H Register

**M37225M6-XXXSP, M37225M8-XXXSP  
M37225ECSP**

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

When setting the block H register to "0016," it needs  $31T_{osc}$  ( $= T_{def1}$ ) from a rising edge (negative polarity) of HSYNC signal to horizontal display start position. The horizontal display start position here indicates the left position of the 1st character's BUTTON display area in BUTTON mode. When also changing character size, the horizontal display start position is the same. In OSD mode, display position is shifted for BUTTON display area (for 2 dots) from that of the same character size in BUTTON mode.

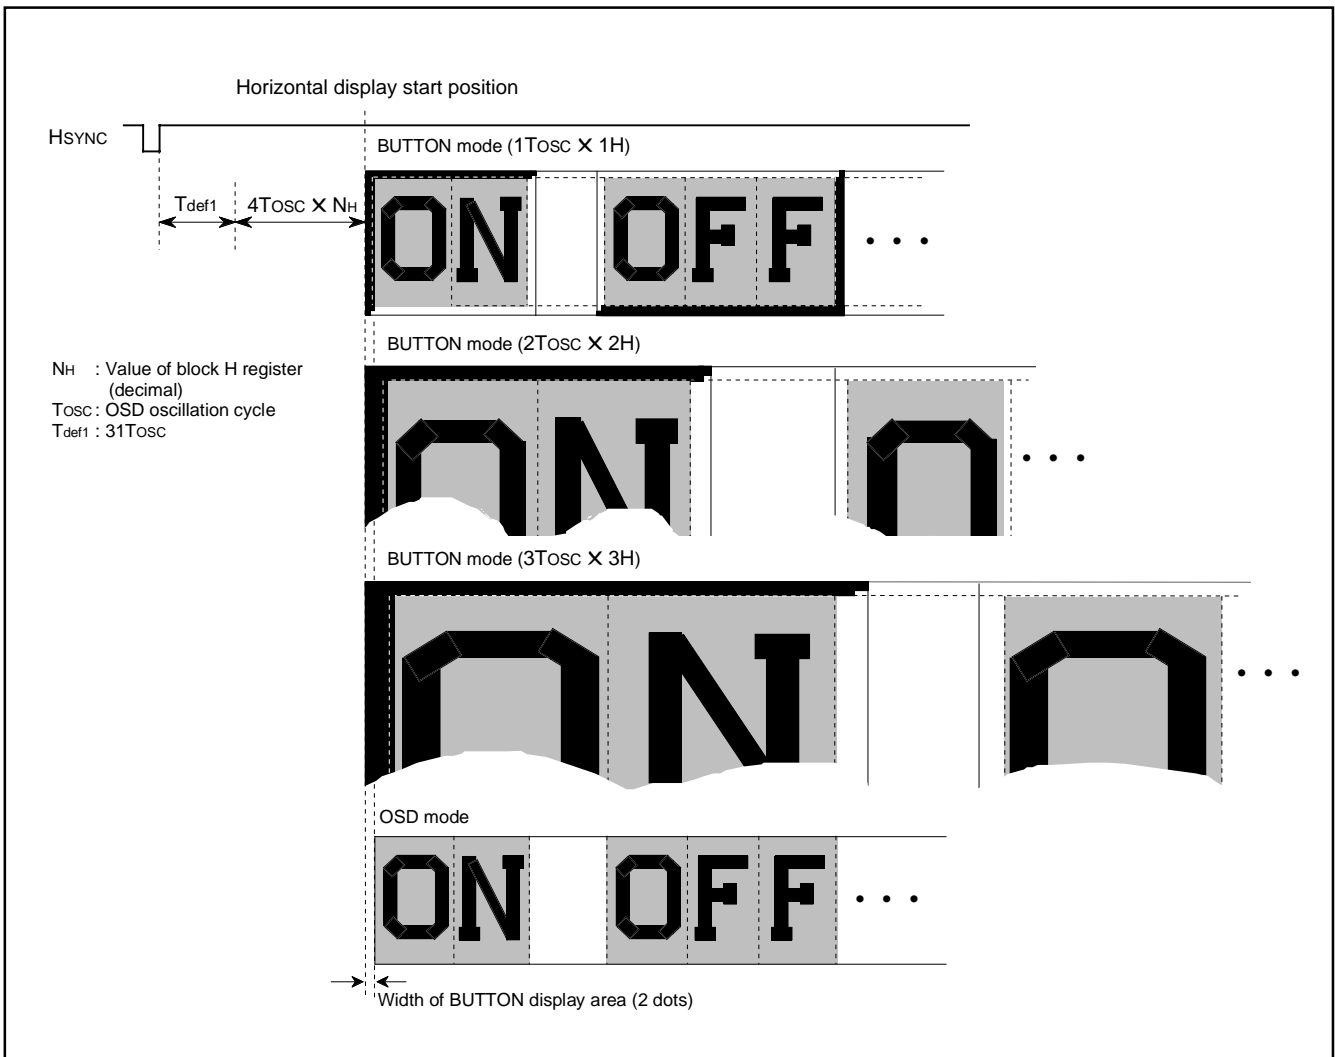

Fig. 8.10.14 Notes on Horizontal Display Start Position

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## (2) Dot size

The dot size can be selected by a block unit. The dot size in vertical direction is determined by dividing HSYNC in the vertical dot size control circuit. The dot size in horizontal is determined by dividing the following clock in the horizontal dot size control circuit : the clock gained by dividing the OSD clock source (OSC1, main clock from pin XIN) in the pre-divide circuit.

The dot size is specified by bits 3 and 4 of the block i control register.

Refer to Figure 8.10.8 (the block i control register).

The block diagram of dot size control circuit is shown in Figure 8.10.15.

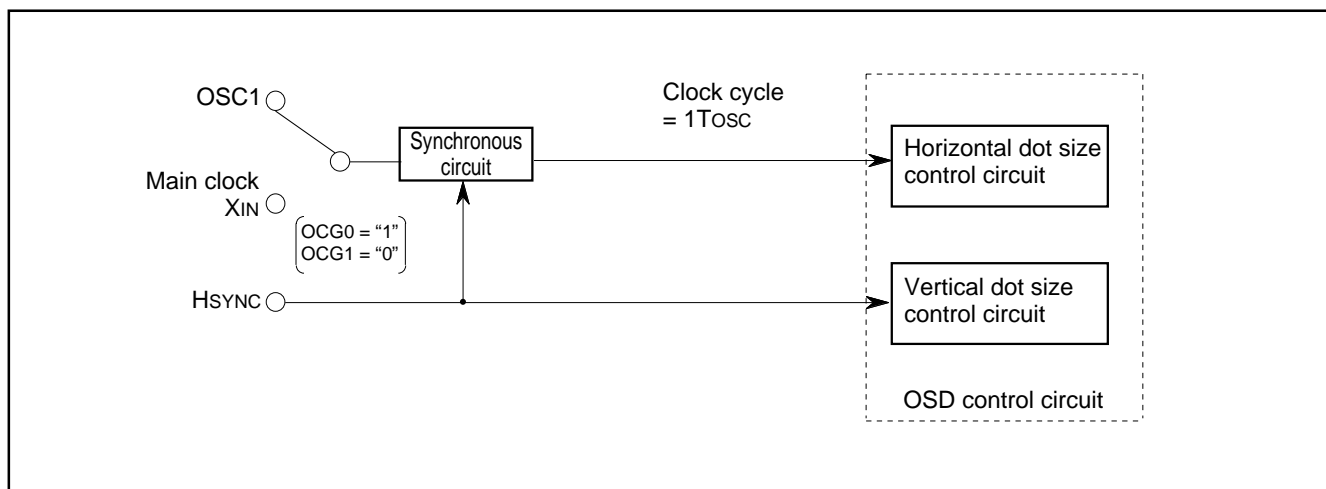

Fig. 8.10.15 Block Diagram of Dot Size Control Circuit

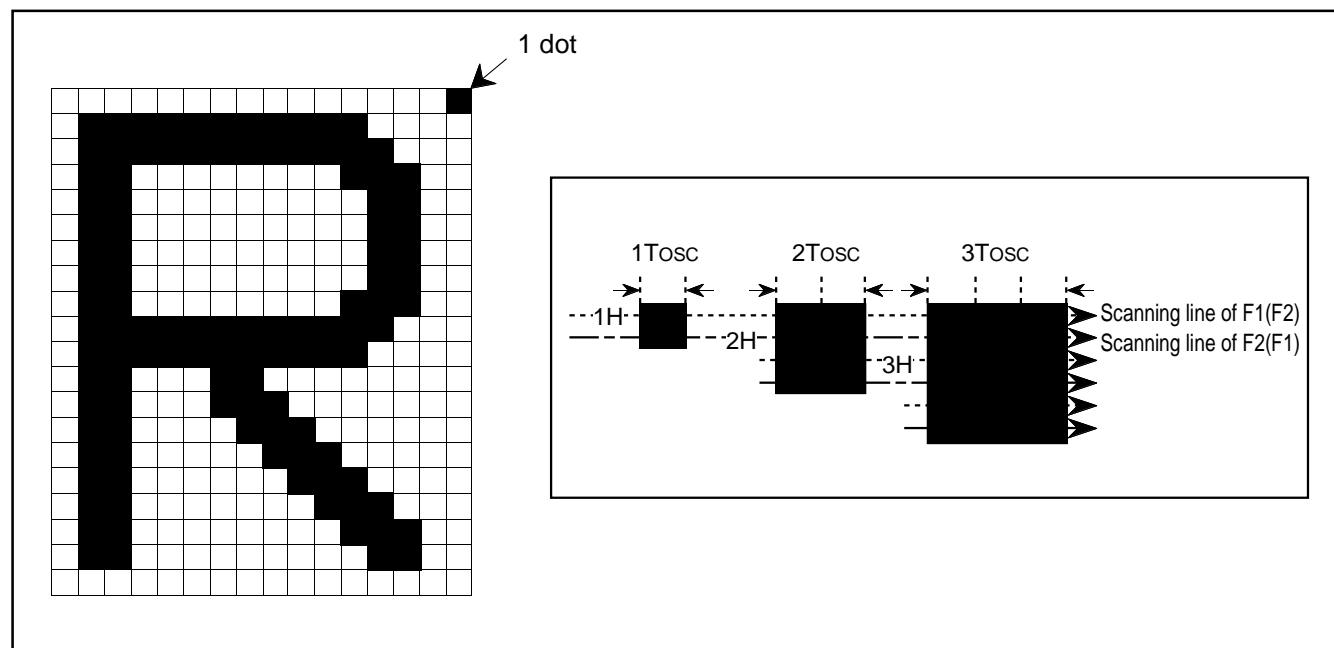

Fig. 8.10.16 Definition of Dot Sizes

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### (3) Memory for OSD

There are 2 types of memory for OSD : OSD ROM (addresses 11400<sub>16</sub> to 13BFF<sub>16</sub> and 15400<sub>16</sub> to 17AFF<sub>16</sub>) used to specify character dot data and OSD RAM (addresses 0800<sub>16</sub> to 0877) used to specify the characters, colors, and attribute. The following describes each type of memory.

- ① **OSD ROM (addresses 11400<sub>16</sub> to 13BFF<sub>16</sub>, 15400<sub>16</sub> to 17AFF<sub>16</sub>)**  
The dot pattern data for OSD characters is stored in the character font area in the OSD ROM. To specify the kinds of the character font, it is necessary to write the character code (based on OSD ROM address) into the OSD RAM. The modes are selected by bit 3 of the OSD control register 3 for each screen.  
The character font data storing address is shown in Figure 8.10.17.

OSD ROM address of character font data

OSD ROM address bit	AD16	AD15	AD14	AD13	AD12	AD11	AD10	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0
Line number / Character code / Font bit	1	0	Character code (high-order 1)	Line number					Character code (low-order 8 bits)								Font bit

Line number = "0A<sub>16</sub>" to "1D<sub>16</sub>"  
 Character code = "000<sub>16</sub>" to "17F<sub>16</sub>" ("07F<sub>16</sub>", "080<sub>16</sub>" and "17F<sub>16</sub>" cannot be used.)  
 Font bit = 0: Left area  
 1: Right area

Character font

Fig. 8.10.17 Character Font Data Storing Address

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

**Note:** The 120-byte addresses corresponding to the character code "07F<sub>16</sub>," "080<sub>16</sub>" and "17F<sub>16</sub>" in OSD ROM are the test data storing area. Set "FF<sub>16</sub>" to the area. (We stores the test data to this area and the different data from "FF<sub>16</sub>" is stored for the actual products.)

<The test data storing area>

- 11000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FE<sub>16</sub> to 11000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + 01<sub>16</sub>
- 15000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FE<sub>16</sub> and 15000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + 01<sub>16</sub> (n = 0 to 19)

Address area

addresses 114FE <sub>16</sub> to 11501 <sub>16</sub>
addresses 116FE <sub>16</sub> to 11701 <sub>16</sub>
⋮

addresses 156FE <sub>16</sub> and 156FF <sub>16</sub>
⋮
addresses 178FE <sub>16</sub> and 178FF <sub>16</sub>
addresses 17AFE <sub>16</sub> and 17AFF <sub>16</sub>

## ② OSD RAM (addresses 0800<sub>16</sub> to 0877<sub>16</sub>)

The OSD RAM for character is allocated at addresses 0800<sub>16</sub> to 0847<sub>16</sub>, 0850<sub>16</sub> to 0857<sub>16</sub>, 0860<sub>16</sub> to 0867<sub>16</sub>, 0870<sub>16</sub> to 0877<sub>16</sub>, and is divided into a display character code specification part 0870<sub>16</sub> to 0877<sub>16</sub>, and color/attribute specification part for each block. Tables 8.10.3 shows the contents of the OSD RAM.

For example, to display 1 character position (the left edge) in block 1, write the character code in address 0800<sub>16</sub>, write color/attribute code at 0810<sub>16</sub>.

The structure of the OSD RAM is shown in Figure 8.10.18.

**Table 8.10.3 Contents of OSD RAM**

Block	Display Position (from left)	Character Code Specification	Color/Attribute Code Specification
Block 1	1st character	0800 <sub>16</sub>	0810 <sub>16</sub>
	2nd character	0801 <sub>16</sub>	0811 <sub>16</sub>
	3rd character	0802 <sub>16</sub>	0812 <sub>16</sub>
	⋮	⋮	⋮
	16th character	080F <sub>16</sub>	081F <sub>16</sub>

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### (4) Character color

Character colors are specified by RA1 to RA3 of OSD RAM.  
Color data are set by color register i (CO1 to CO8: addresses 00E6<sub>16</sub> to 00E9<sub>16</sub>, 00EC<sub>16</sub> to 00EF<sub>16</sub>) in advance, and 8 kinds of color register i are specified by color codes.

### (5) Character background color

Character background are specified by color register i as same as character color.

**Note :** The character background is displayed in the following part:  
(character display area) – (character font) — (border) – (BUTTON display area)  
Accordingly, the character background color and the color signal for these sections cannot be mixed.

### (6) OUT1, OUT2 signals

OUT1 signal is used to erase a back ground TV image. The output waveform of OUT1 signal is controlled by combining the following bits; the display mode selection bits (bits 0 to 2 of the block i control register), the border type selection bit (bit 1 of the OSD control register), and the OUT1 output control bit (bit 6 of color register i).

Figure 8.10.20 and 8.10.21 shows the output example of R, G, B, and OUT1.

OUT2 signal is used to change the luminance of a background TV image. The output waveform of OUT2 signal is blank output and is controlled per character unit by RA6 of OSD RAM.

with ON-SCREEN DISPLAY CONTROLLER

## (7) Attribute (block display)

The attributes (border, BUTTON display, block shadow display) are controlled to the character font. The display mode is specified per block unit by bits 0 to 2 of the block i control register. The attributes to be controlled are different depending on each mode.

OSD mode ..... Border

BUTTON mode ..... Border, BUTTON display, block shadow display

### ① Border

The border is output in the OSD and BUTTON modes. The all bordered (bordering around of character font) and the shadow bordered (bordering right and bottom sides of character font) are selected per screen unit by bit 1 of OSD control register (refer to Figure 8.10.4). The ON/OFF switch for borders can be controlled per block unit by bit 2 of the block i control register (refer to Figure 8.10.8).

The OUT1 signal is used for border output.

The horizontal size (x) of border is 1Tosc (Tosc: OSD oscillation cycle) regardless of the character font dot size. The vertical size (y) is 1H (2H in the bi-scan mode) regardless of character font.

**Notes 1:** The border dot area is the shaded area as shown in Figure 8.10.23.

**2:** When the border dot overlaps on the next character font, the character font has priority (refer to Figure 8.10.22 A). When the border dot overlaps on the next character back ground, the border has priority (refer to Figure 8.10.22 B).

**3:** The border in vertical out of character area is not displayed in OSD mode (refer to Figure 8.10.22).

Fig. 8.10.22 Border Priority

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

### ② BUTTON display

There are 2 kinds of displays; ON BUTTON display and OFF BUTTON display. The BUTTON display is controlled per character unit by RA4 and RA5 of OSD RAM.

The BUTTON display area is around the character display area in the BUTTON mode. The ON/OFF BUTTON is displayed by outputting white (R + G + B) or black (OUT) to this area.

The horizontal size (x) of BUTTON display area is for 2 dots regardless of the character font dot size. The vertical size (y) is for 2 dots regardless of the vertical dot size of character font.

### ③ Block shadow display

The block shadow is displayed to the character display area in the BUTTON mode. The block shadow display is controlled per character unit by RA4 and RA5 of OSD RAM.

Figure 8.10.24 shows each display example. The BUTTON/block shadow can be displayed to the character area where combined arbitrary (within 24 characters for a block). Set each character in this case, too. Set "0" to all attribute codes between ON BUTTON, OFF BUTTON and block shadow displays.

Fig. 8.10.24 ON/OFF BUTTON Display and Block Shadow Display

with ON-SCREEN DISPLAY CONTROLLER

## (8) Multiline display

This microcomputer can ordinarily display 2 lines on the CRT screen by displaying 2 blocks at different vertical positions. In addition, it can display 3 lines or more by using OSD interrupts.

An OSD interrupt request occurs at the point at which display of each block has been completed. In other words, when a scanning line reaches the point of the display position (specified by the block i V registers) of a certain block, the character display of that block starts, and an interrupt occurs at the point at which the scanning line exceeds the block.

- Notes 1:** An OSD interrupt does not occur at the end of display when the block is not displayed. In other words, if a block is set to off display by the display control bit of the block control register i (addresses 00F916 and 00FA16), an OSD interrupt request does not occur (refer to Figure 8.10.26 (A)).
- 2:** When another block display appears while one block is displayed, an OSD interrupt request occurs only once at the end of the another block display (refer to Figure 8.10.26 (B)).
- 3:** On the screen setting window, an OSD interrupt occurs even at the end of the block (off display) out of window (refer to Figure 12.11.36 (C)).

Fig. 8.10.26 Note on Occurrence of OSD Interrupt

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## (9) Window function

The window function can be set windows on-screen, and output OSD within only the area where the window is set.

The ON/OFF for vertical window function is performed by bit 4 of the OSD control register. The top boundary is set by the top border control register (TBR) and the bottom boundary is set by bottom border control register (BBR). The left boundary is set by the left border control register (LBR), and the right boundary is set by the right border control register (RBR).

The left and right boundarys can be adjusted minutely by bits 2 and 3 of the OSD control register (address 00EA16).

**Note:** The SPRITE display is not effected by the window function.

## 8.10.2 SPRITE Display

This is especially suitable for cursor and other displays as its function allows for display in any position, regardless of the validity of other OSDs or display positions. Each SPRITE font is ROM font consisting of 16 horizontal dots X 20 vertical dots, and there are 4 kinds. When SPRITE display overlaps with other OSDs, SPRITE display is always given priority.

To display SPRITE font, OSD ROM font data for 2 characters is used. These 2 fonts can be colored with any color and can be displayed by synthesizing as a character. The features and display example of SPRITE display are shown below.

- Notes 1:** The SPRITE display is not effected by the window function.
- 2:** The SPRITE display cannot output character background color or OUT2.

**Table 8.10.4 Features of SPRITE Display**

Parameter	Features
Number of display characters	1 characters X 1 line (display by synthesizing 2 kinds of characters)
Dot structure	16 X 20 dots (See note 3)
Kinds of characters	4 kinds (Character code = "F816" to "FF16") (See note 4)
Kinds of character sizes	1 kind
Dot size	1Tosc X 1H (See notes 5, 7, 8)
Character font coloring	Synthesis SPRITE fonts 1 and 2 (per SPRITE font unit)
OSD output	R, G, B
Other functions	Corresponding to bi-scan
Display position	Horizontal: 253 levels (See note 2), Vertical: 255 levels (See note 1)

- Notes 1:** It is possible to set in any position regardless of vertical display positions of the block display. The vertical display start positions of the SPRITE display is the same as that of the block display.
- 2:** It is possible to set in any position regardless of horizontal display position of block display.
- 3:** It is the same display area as OSD mode (refer to "Figure 8.10.3").
- 4:** As for character font data storing address refer to "8.10.1 Block Display (3) Memory for OSD." The characters of character codes "F816" to "FF16" can be also used for the block display.
- 5:** Refer to "8.10.1 Block Display (2) Dot size." The dot size in the bi-scan mode is 1Tosc X 2H.
- 6:** Refer to "8.10.1 Block Display (4) Character color." Only color registers 1 to 4 can be specified.
- 7:** H = HSYNC
- 8:** TOSC = OSD oscillation cycle

with ON-SCREEN DISPLAY CONTROLLER

### 8.10.3 Raster Display

The raster display is displayed on the lower layer than the SPRITE and block layers. There are 2 kinds of displays; the flat display and the patterning display.

In the raster flat display, an entire screen (raster) can be colored by setting the following bits; bits 5 to 7 of the OSD I/O polarity register and bits 6 and 7 of the OSD control register. Since each of the R, G, B, OUT1, and OUT2 pins can be switched to raster coloring output, 8 raster colors can be obtained.

In the raster patterning display, SPRITE fonts are displayed repeatedly on an entire screen (raster). At this time, set "1" to bits 6 and 7 of the SPRITE control register.

Horizontal display start positions of the raster patterning display are set by the SPRITE H register. At this time, setting value is synchronized with VSYNC signal.

Characters for patterning are set by bits 4 and 5 of the SPRITE control register and coloring are set by bits 0 to 3. The raster color is output on the background of SPRITE font.

Note that the raster patterning display and the SPRITE display cannot be used at the same time.

When the character color/the character background color overlaps with the raster color, the color (R, G, B, OUT1, OUT2), specified for the character color/the character background color, takes priority of the raster color. This ensures that the character color/the character background color is not mixed with the raster color.

The raster flat display example is shown in Figure 8.10.36, the raster patterning display example is shown in Figure 8.10.37.

Fig. 8.10.36 Raster Flat Display Example

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

When setting "0316" to SPRITE H register, it is need  $T_{def2} + 2T_{osc} \times 3 = 8T_{osc}$  intervals from a rising edge (negative polarity) of HSYNC signal to a horizontal display start position.

**Note:** Do not set "0" to "2" to  $NH'$ .

## 8.11 SOFTWARE RUNAWAY DETECT FUNCTION

This microcomputer has a function to decode undefined instructions to detect a software runaway.

When an undefined op-code is input to the CPU as an instruction code during operation, the following processing is done.

- ① The CPU generates an undefined instruction decoding signal.
- ② The device is internally reset because of occurrence of the undefined instruction decoding signal.
- ③ As a result of internal reset, the same reset processing as in the case of ordinary reset operation is done, and the program restarts from the reset vector.

Note, however, that the software runaway detecting function cannot be invalid.

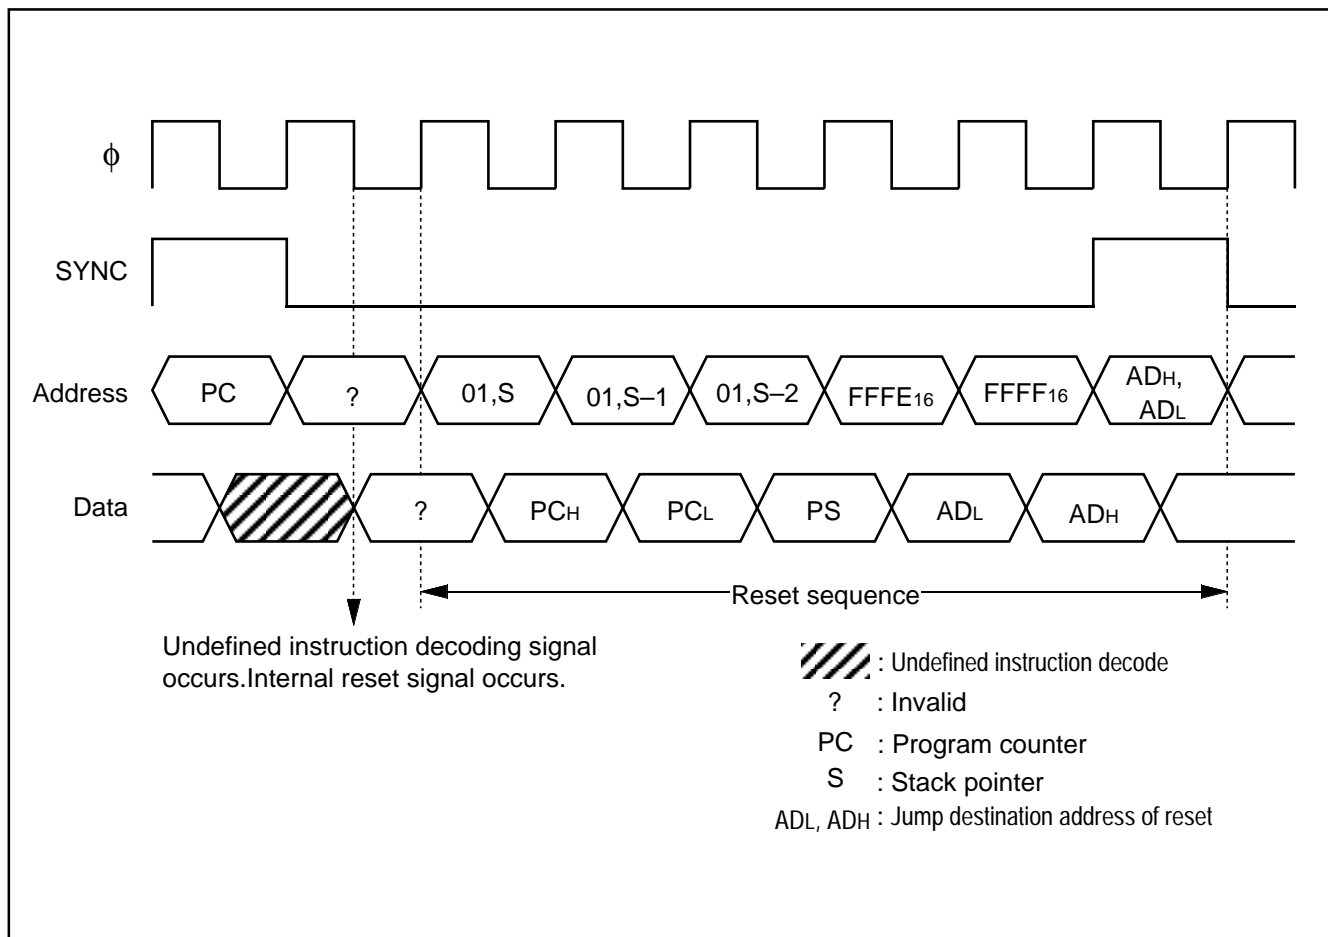

Fig.8.11.1 Sequence at Detecting Software Runaway Detection

# M37225M6-XXXSP, M37225M8-XXXSP M37225ECSP

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.12. RESET CIRCUIT

When the oscillation of a quartz-crystal oscillator or a ceramic resonator is stable and the power source voltage is  $5\text{ V} \pm 10\%$ , hold the  $\overline{\text{RESET}}$  pin at LOW for  $2\ \mu\text{s}$  or more, then return it to HIGH. Then, as shown in Figure 8.12.2, reset is released and the program starts from the address formed by using the content of address  $\text{FFFF}_{16}$  as the high-order address and the content of the address  $\text{FFFE}_{16}$  as the low-order address. The internal state of microcomputer at reset are shown in Figures 8.2.3 to 8.2.6.

An example of the reset circuit is shown in Figure 8.12.1. The reset input voltage must be kept 0.9 V or less until the power source voltage surpasses 4.5 V.

Fig.8.12.1 Example of Reset Circuit

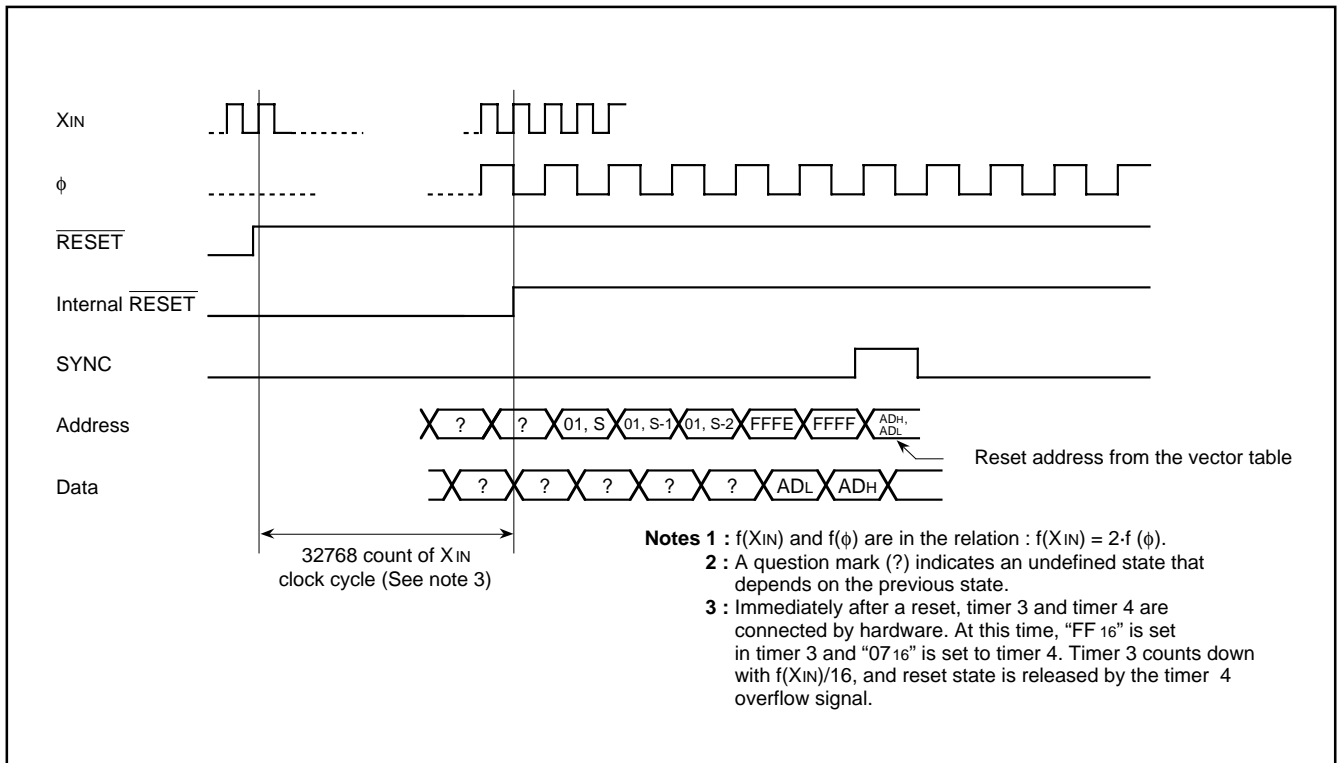

Fig.8.12.2 Reset Sequence

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.13 CLOCK GENERATING CIRCUIT

The built-in clock generating circuit is shown in Figure 8.13.3. When the STP instruction is executed, the internal clock  $\phi$  stops at HIGH. At the same time, timers 3 and 4 are connected by hardware and "FF16" is set in timer 3 and "0716" is set in the timer 4. Select  $f(XIN)/16$  as the timer 3 count source (set bit 0 of the timer mode register 2 to "0" before the execution of the STP instruction). Moreover, set the timer 3 and timer 4 interrupt enable bits to disabled ("0") before execution of the STP instruction). The oscillator restarts when external interrupt is accepted. However, the internal clock  $\phi$  keeps its HIGH until timer 4 overflows, allowing time for oscillation stabilization when a ceramic resonator or a quartz-crystal oscillator is used.

When the WIT instruction is executed, the internal clock  $\phi$  stops in the HIGH but the oscillator continues running. This wait state is released when an interrupt is accepted (See note). Since the oscillator does not stop, the next instruction can be executed at once.

When returning from the stop or the wait state, to accept an interrupt, set the corresponding interrupt enable bit to "1" before executing the STP or the WIT instructions.

**Note:** In the wait mode, the following interrupts are invalid.

- VSYNC interrupt
- OSD interrupt
- Timer 2 interrupt using external clock input from TIM2 pin as count source
- Timer 3 interrupt using external clock input from TIM3 pin as count source
- Timer 4 interrupt using  $f(XIN)/2$  as count source
- Timer 1 interrupt using  $f(XIN)/4096$  as count source
- $f(XIN)/4096$  interrupt
- Multi-master I<sup>2</sup>C-BUS interface interrupt
- A-D conversion interrupt
- SPRITE interrupt

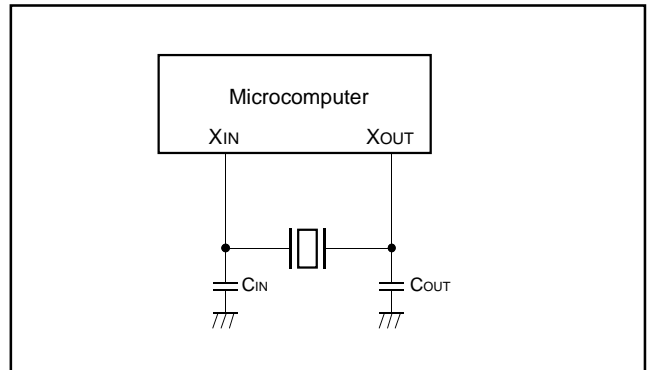

Fig.8.13.1 Ceramic Resonator Circuit Example

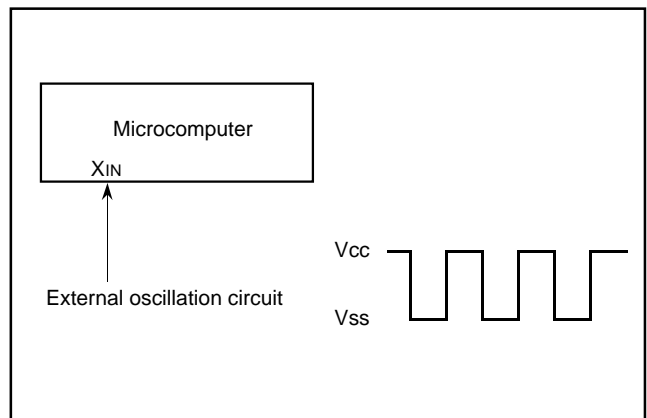

Fig.8.13.2 External Clock Input Circuit Example

A circuit example using a ceramic resonator (or a quartz-crystal oscillator) is shown in Figure 8.13.1. Use the circuit constants in accordance with the resonator manufacturer's recommended values. A circuit example with external clock input is shown in Figure 8.13.2. Input the clock to the XIN pin, and open the XOUT pin.

Fig.8.13.3 Clock Generating Circuit Block Diagram

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER for VOLTAGE SYNTHESIZER  
with ON-SCREEN DISPLAY CONTROLLER

## 8.14 DISPLAY OSCILLATION CIRCUIT

The OSD oscillation circuit has a built-in clock oscillation circuits, so that a clock for OSD can be obtained simply by connecting an LC, a ceramic resonator, or a quartz-crystal oscillator across the pins OSC1 and OSC2. Which of the sub-clock or the OSD oscillation circuit is selected by setting bits 0 and 1 of the interrupt input polarity register (address 00CD16).

Fig.8.14.1 Display Oscillation Circuit

## 8.15 AUTO-CLEAR CIRCUIT

When a power source is supplied, the auto-clear function will operate by connecting the following circuit to the  $\overline{\text{RESET}}$  pin.

Fig.8.15.1 Auto-clear Circuit Example

## 8.16 ADDRESSING MODE

The memory access is reinforced with 17 kinds of addressing modes. Refer to SERIES 740 <Software> User's Manual for details.

## 8.17 MACHINE INSTRUCTIONS

There are 71 machine instructions. Refer to SERIES 740 <Soft-ware> User's Manual for details.

## 9. PROGRAMMING NOTES

- The divide ratio of the timer is  $1/(n+1)$ .
- Even though the BBC and BBS instructions are executed immediately after the interrupt request bits are modified (by the program), those instructions are only valid for the contents before the modification. At least one instruction cycle is needed (such as an NOP) between the modification of the interrupt request bits and the execution of the BBC and BBS instructions.
- After the ADC and SBC instructions are executed (in the decimal mode), one instruction cycle (such as an NOP) is needed before the SEC, CLC, or CLD instruction is executed.
- An NOP instruction is needed immediately after the execution of a PLP instruction.
- In order to avoid noise and latch-up, connect a bypass capacitor ( $\approx 0.1\mu\text{F}$ ) directly between the Vcc pin-Vss pin, AVcc pin-Vss pin, and the Vcc pin-CNvss pin, using a thick wire.

VOL	LOW output voltage	P52-P55, P00-P07, P10, P15-P17, P20-P23, P30-P32, P35	VCC = 4.5 V IOL = 0.5 mA			0.4	V		
	LOW output voltage	P24-P27	VCC = 4.5 V IOL = 10.0 mA			3.0			
	LOW output voltage	P11-P14	VCC = 4.5 V	IOL = 3 mA		0.4			
						0.6			
Vt+ - Vt-	Hysteresis (See note 6)	RESET, P50, P51, TIM2, TIM3, INT1-INT3, SCL1, SCL2, SDA1, SDA2, SIN, SCLK	VCC = 5.0 V		0.5	1.3	V	3	
IIZH	HIGH input leak current	RESET, P00-P07, P10-P17, P20-P27, P30-P35, P50, P51	VCC = 5.5 V VI = 5.5 V			5	µA	4	
IIZL	LOW input leak current	RESET, P00-P07, P10-P17, P20-P27, P30-P35, P50, P51	VCC = 5.5 V VI = 0 V			5	µA		
IOZH	HIGH input leak current	P00-P05	VCC = 5.5 V VI = 12 V			10	µA	5	
RBS	I <sup>2</sup> C-BUS-BUS switch connection resistor (between SCL1 and SCL2, SDA1 and SDA2)		VCC = 4.5 V			130	Ω	6	

- Notes 1:** The total current that flows out of the IC must be 20 mA or less.  
**2:** The total input current to IC (IOL1 + IOL2 + IOL3) must be 30 mA or less.  
**3:** The total average input current for ports P24-P27 to IC must be 20 mA or less.  
**4:** Connect 0.1 µF or more capacitor externally between the power source pins VCC-VSS so as to reduce power source noise.  
 Also connect 0.1 µF or more capacitor externally between the pins VCC-CNVSS.  
**5:** Use a quartz-crystal oscillator or a ceramic resonator for the CPU oscillation circuit. When using the data slicer, use 8 MHz.  
**6:** P06, P07, P15, P23, P24 have the hysteresis when these pins are used as interrupt input pins or timer input pins. P11-P14 have the hysteresis when these pins are used as multi-master I<sup>2</sup>C-BUS interface ports. P20-P22 have the hysteresis when these pins are used as serial I/O pins.  
**7:** Pin names in each parameter is described as below.  
 (1) Dedicated pins: dedicated pin names.  
 (2) Duple-/triple-function ports  
 • When the same limits: I/O port name.  
 • When the limits of functins except ports are different from I/O port limits: function pin name.

Three EPROMs are required for each pattern if this order is performed by EPROMs.  
One floppy disk is required for each pattern if this order is performed by a floppy disk.

#### Ordering by EPROMs

If at least two of the three sets of EPROMs submitted contain identical data, we will produce masks based on this data. We shall assume the responsibility for errors only if the mask ROM data on the products we produce differs from this data. Thus, extreme care must be taken to verify the data in the submitted EPROMs.

Checksum code for entire EPROM 

--	--	--	--

 (hexadecimal notation)

EPROM type (indicate the type used)

(1) Set "FF<sub>16</sub>" in the shaded area.

(2) Write the ASCII codes that indicate the product name of "M37225M6-" to addresses 00000<sub>16</sub> to 0000F<sub>16</sub>.

Addresses 00000<sub>16</sub> to 0000F<sub>16</sub> store the product name.

ASCII codes 'M37225M6-' are listed on the right.

The addresses and data are in hexadecimal notation.

address and data are described in hexadecimal notation.

**Note:** If the name of the product contained in the EPROMs does not match the name on the mask ROM confirmation form, the ROM processing is disabled. Please make sure the data is written correctly.

## 740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M37225M6-XXXSP MITSUBISHI ELECTRIC

### Inputting the character ROM

OSD ROM address of character font data

OSD ROM address bit	AD16	AD15	AD14	AD13	AD12	AD11	AD10	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0
Line number / Character code / Font bit	1	0	Character code (high-order 1)	Line number					Character code (low-order 8 bits)								Font bit

Line number = "0A<sub>16</sub>" to "1D<sub>16</sub>"  
Character code = "000<sub>16</sub>" to "17F<sub>16</sub>" ("07F<sub>16</sub>", "080<sub>16</sub>" and "17F<sub>16</sub>" cannot be used.)  
Font bit = 0: Left area  
1: Right area

Example) The font data "60" (shaded area ) of the character code "0AA<sub>16</sub>" is stored in address

$$1 \cdot 0 \cdot 0 \cdot 1 \cdot 0 \cdot 0 \cdot 1 \cdot 0 \cdot 1 \cdot 0 \cdot 1 \cdot 0 \cdot 1 \cdot 0 \cdot 0 \cdot 1 \cdot 0 \cdot 0 \cdot 2 = 12554_{16}$$

Character code "0AA<sub>16</sub>"

**Note:** The 120-byte addresses corresponding to the character codes "07F<sub>16</sub>", "080<sub>16</sub>" and "1F<sub>16</sub>" in OSD ROM are the test data storing area. Set "FF<sub>16</sub>" to the area (We stores the test data to this area and the different data from "FF<sub>16</sub>" is stored for the actual products.)

The test data storing area :

- addresses 11000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FE<sub>16</sub> to 11000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + 01<sub>16</sub> (n = 0 to 19)
- addresses 15000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FE<sub>16</sub> and 15000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FF<sub>16</sub> (n = 0 to 19)

addresses 114FE <sub>16</sub> to 11501 <sub>16</sub>
addresses 116FE <sub>16</sub> to 11701 <sub>16</sub>
⋮
addresses 138FE <sub>16</sub> to 13901 <sub>16</sub>
addresses 13AFE <sub>16</sub> to 13B01 <sub>16</sub>

addresses 154FE <sub>16</sub> and 154FF <sub>16</sub>
addresses 156FE <sub>16</sub> and 156FF <sub>16</sub>
⋮
addresses 178FE <sub>16</sub> and 178FF <sub>16</sub>
addresses 17AFE <sub>16</sub> and 17AFF <sub>16</sub>

The 5120-byte addresses corresponding to the character codes "180<sub>16</sub>" to "1FF<sub>16</sub>" are not in OSD ROM. Set "FF<sub>16</sub>" to the area, too.

- addresses 15000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + 00<sub>16</sub> to 15000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + FF<sub>16</sub> (n = 0 to 19)

addresses 15500 <sub>16</sub> to 155FF <sub>16</sub>
addresses 15700 <sub>16</sub> to 157FF <sub>16</sub>
⋮
addresses 17900 <sub>16</sub> to 179FF <sub>16</sub>
addresses 17B00 <sub>16</sub> to 17BFF <sub>16</sub>

## 740 FAMILY MASK ROM CONFIRMATION FORM SINGLE-CHIP MICROCOMPUTER M37225M8-XXXSP MITSUBISHI ELECTRIC

Inputting the character ROM

OSD ROM address of character font data

OSD ROM address bit	AD16	AD15	AD14	AD13	AD12	AD11	AD10	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0
Line number / Character code / Font bit	1	0	Character code (high-order 1)	Line number					Character code (low-order 8 bits)								Font bit

Line number = "0A<sub>16</sub>" to "1D<sub>16</sub>"  
 Character code = "000<sub>16</sub>" to "17F<sub>16</sub>" ("07F<sub>16</sub>", "080<sub>16</sub>" and "17F<sub>16</sub>" cannot be used.)  
 Font bit = 0: Left area  
 1: Right area

Example) The font data "60" (shaded area ) of the character code "0AA<sub>16</sub>" is stored in address

$$1;0\ 0\ 1\ 0;0\ 1\ 0\ 1;0\ 1\ 0\ 1;0\ 1\ 0\ 0;2 = 12554_{16}$$

Character code "0AA<sub>16</sub>"

**Note:** The 120-byte addresses corresponding to the character codes "07F<sub>16</sub>," "080<sub>16</sub>" and "1F<sub>16</sub>" in OSD ROM are the test data storing area. Set "FF<sub>16</sub>" to the area (We stores the test data to this area and the different data from "FF<sub>16</sub>" is stored for the actual products.)

The test data storing area :

- addresses 11000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FE<sub>16</sub> to 11000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + 01<sub>16</sub> (n = 0 to 19)
- addresses 15000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FE<sub>16</sub> and 15000<sub>16</sub> + (4 + 2n) X 100<sub>16</sub> + FF<sub>16</sub> (n = 0 to 19)

addresses 114FE<sub>16</sub> to 11501<sub>16</sub>  
 addresses 116FE<sub>16</sub> to 11701<sub>16</sub>  
 ⋮  
 addresses 138FE<sub>16</sub> to 13901<sub>16</sub>  
 addresses 13AFE<sub>16</sub> to 13B01<sub>16</sub>

addresses 154FE<sub>16</sub> and 154FF<sub>16</sub>  
 addresses 156FE<sub>16</sub> and 156FF<sub>16</sub>  
 ⋮  
 addresses 178FE<sub>16</sub> and 178FF<sub>16</sub>  
 addresses 17AFE<sub>16</sub> and 17AFF<sub>16</sub>

The 5120-byte addresses corresponding to the character codes "180<sub>16</sub>" to "1FF<sub>16</sub>" are not in OSD ROM. Set "FF<sub>16</sub>" to the area, too.

- addresses 15000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + 00<sub>16</sub> to 15000<sub>16</sub> + (5 + 2n) X 100<sub>16</sub> + FF<sub>16</sub> (n = 0 to 19)

addresses 15500<sub>16</sub> to 155FF<sub>16</sub>  
 addresses 15700<sub>16</sub> to 157FF<sub>16</sub>  
 ⋮  
 addresses 17900<sub>16</sub> to 179FF<sub>16</sub>  
 addresses 17B00<sub>16</sub> to 17BFF<sub>16</sub>

## 18. MARK SPECIFICATION FORM

### 42P4B (42-PIN SHRINK DIP) MARK SPECIFICATION FORM

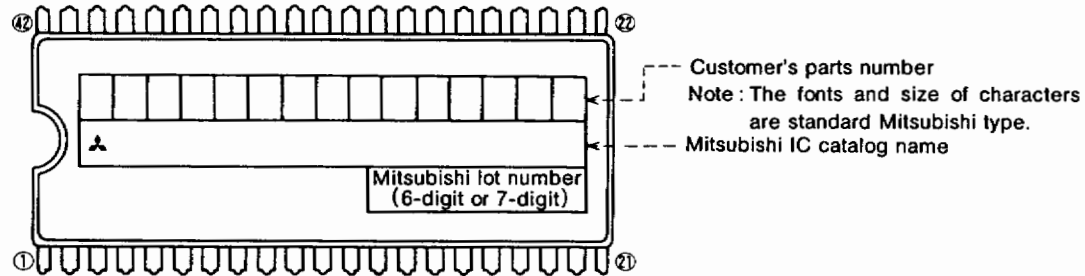

Mitsubishi IC catalog name

Please choose one of the marking types below (A, B, C), and enter the Mitsubishi IC catalog name and the special mark (if needed).

#### A. Standard Mitsubishi Mark

#### B. Customer's Parts Number + Mitsubishi Catalog Name

Note1 : The mark field should be written right aligned.

2 : The fonts and size of characters are standard Mitsubishi type.

3 : Customer's parts number can be up to 15 characters :

Only 0~9, A~Z, +, -, /, (, ), &, ©, . (period), and , (comma) are usable.

4 : If the Mitsubishi logo ♣ is not required, check the box on the right.

♣Mitsubishi logo is not required

#### C. Special Mark Required

Note1 : If the special mark is to be printed, indicate the desired layout of the mark in the upper figure. The layout will be duplicated as close as possible. Mitsubishi lot number (6-digit or 7-digit) and mask ROM number (3-digit) are always marked.

2 : If the customer's trade mark logo must be used in the special mark, check the box below. Please submit a clean original of the logo.

For the new special character fonts a clean font original (ideally logo drawing) must be submitted.

The standard Mitsubishi font is used for all characters except for a logo.

Special logo required

with ON-SCREEN DISPLAY CONTROLLER

## Structure of Register

The figure of each register structure describes its functions, contents at reset, and attributes as follows:

<Example>

CPU Mode Register

b7 b6 b5 b4 b3 b2 b1 b0

		1	1	0	0	0	0

CPU mode register (CPUM) (CM) [Address 00FB16]

B	Name	Functions	After re	R/W
0, 1	Processor mode bits (CM0, CM1)	b1 b0 0 0: Single-chip mode 0 1: } 1 0: } Not available 1 1: }	0	R/W
2	Stack page selection bit (See note) (CM2)	0: 0 page 1: 1 page	1	R/W
3, 4	Fix these bits to "1."		1	R/W
5	Nothing is assigned. This bit is write disable bit. When this bit is read out, the value is "1."		1	R/W
6, 7	Clock switch bits (CM6, CM7)	b7 b6 0 0: f(XIN) = 8 MHz 0 1: f(XIN) = 12 MHz 1 0: f(XIN) = 16 MHz 1 1: Do not set	0	R/W

■ : Bit in which nothing is assigned

**Notes 1:** Values immediately after reset release  
 0 ..... "0" after reset release  
 1 ..... "1" after reset release  
 Indeterminate... Indeterminate after reset release

**2:** Bit attributes..... The attributes of control register bits are classified into 3 types : read-only, write-only and read and write. In the figure, these attributes are represented as follows :

<p>R.....Read</p> <p>R.....Read enabled</p> <p>-.....Read disabled</p>	<p>W.....Write</p> <p>W.....Write enabled</p> <p>-.....Write disabled</p> <p>*....."0" can be set by software, but "1" cannot be set.</p>

Interrupt Input Polarity Register

b7 b6 b5 b4 b3 b2 b1 b0

Interrupt input polarity register (IP) [Address 00CD<sub>16</sub>]

b	Name	Function	After reset	R	W	
0, 1	OSD clock selection bits (OCG0, OCG1)	b1 b0		0	R	W
		Function				
		0 0	The clock for OSD is supplied by connecting RC or LC across the pins OSC1 and OSC2. However, it is not corresponding to the bi-scan mode.			
		0 1	Since the main clock is used as the clock for OSD, the oscillation frequency is limited. Because of this, the character size in width (horizontal) direction is also limited. In this case, pins OSC1 and OSC2 are also used as input ports P3 <sub>3</sub> and P3 <sub>4</sub> respectively. OSD oscillation frequency = f(X <sub>IN</sub> )			
1 0	The clock for OSD is supplied by connecting LC across the pins OSC1 and OSC2. In the bi-scan mode, be sure to set this.					
1 1	The clock for OSD is supplied by connecting the following across the pins OSC1 and OSC2. However, it is not corresponding to the bi-scan mode. • a ceramic resonator only for OSD and a feedback resistor • a quartz-crystal oscillator only for OSD and a feedback resistor					
2	Fix this bit to "0."		0	R	W	
3	INT1 polarity switch bit (POL1)	0 : Positive polarity 1 : Negative polarity	0	R	W	
4	INT2 polarity switch bit (POL2)	0 : Positive polarity 1 : Negative polarity	0	R	W	
5	INT3 polarity switch bit (POL3)	0 : Positive polarity 1 : Negative polarity	0	R	W	
6, 7	Fix these bits to "0."		0	R	W

**Keep safety first in your circuit designs!**

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

**Notes regarding these materials**

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- The information described here may contain technical inaccuracies or typographical errors. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors. Please also pay attention to information published by Mitsubishi Electric Corporation by various means, including the Mitsubishi Semiconductor home page (<http://www.mitsubishichips.com>).
- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Mitsubishi Electric Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
- Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
