EPROM MODE

The M37414E5-XXXFP features an EPROM mode in addition to its normal modes. When the RESET signal level is low ("L"), the chip automatically enters the EPROM mode. Table 1 lists the correspondence between pins and Figure 1 gives the pin connection in the EPROM mode. When in the EPROM mode, ports P0, P1, P2, P4₀~P4₂, and CNV_{SS} are used for the PROM (equivalent to the M5L27128). When in this mode, the built-in PROM can be written to or read from using these pins in the same way as with the M5L27128. The oscillator should be connected to the X_{IN} and X_{OUT} pins, or external clock should be connected to the X_{IN} pin.

PROM READING AND WRITING

Reading

To read the PROM, set the \overline{CE} and \overline{OE} pins to a "L" level, and the \overline{PGM} pin to a "H" level. Input the address of the data ($A_0 \sim A_{13}$) to be read and the data will be output to the I/O pins $D_0 \sim D_7$. The data I/O pins will be floating when either the \overline{CE} or \overline{OE} pins are in the "H" state.

Writing

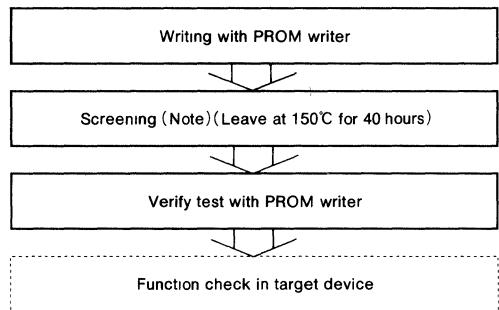

To write to the PROM, set the \overline{CE} pin to a "L" level and the \overline{OE} pin to a "H" level. The CPU will enter the program mode when V_{PP} is applied to the V_{PP} pin. The address to be written to is selected with pins $A_0 \sim A_{13}$, and the data to be written is input to pins $D_0 \sim D_7$. Set the \overline{PGM} pin to a "L" level to begin writing.

Notes on Writing

When using an PROM writer, the address range should be between 1800_{16} and $3FFF_{16}$. When data is written between addresses 0000_{16} and $3FFF_{16}$, fill addresses 0000_{16} to $17FF_{16}$ with 00_{16} .

NOTES ON HANDLING

- (1) Since a high voltage (21V) is used to write data, care should be taken when turning on the PROM writer's power.
- (2) For the programmable microcomputer (shipped in blank or OTP type), Mitsubishi does not perform PROM write test and screening in the assembly process and following processes. To improve reliability after write, performing write and test according to the flow below before use is recommended.

Note : Since the screening temperature is higher than storage temperature, never expose to 150°C exceeding 100 hours.
