6.0 Input/Output Function Description

Symbol	Type	Description
CK0-CK2 CK0-CK2	Input	CK and CK are differential clock inputs. All the SDRAM addr/cntl inputs are sampled on the crossing of positive edge of CK and negative edge of CK. Output (read) data is reference to the crossing of CK and CK (Both directions of crossing)
CKE0-CKE1	Input	Activates the SDRAM CK signal when high and deactivates the CK Signal When low. By deactivating the clocks, CKE low initiates the Powe Down mode, or the Self-Refresh mode
S0-S1	Input	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disbled, new command are ignored but previous operations continue. This signal provides for external rank selection on systems with multiple ranks
RAS, CAS, WE	Input	RAS, CAS, and WE (ALONG WITH CS) define the command being entered.
ODT0-ODT1	Input	When high, termination resistance is enabled for all DQ, DQ and DM pins, assuming the function is enabled in the Extended Mode Register Set (EMRS).
V_{REF}	Supply	Reference voltage for SSTL 18 inputs.
V_{DDQ}	Supply	Power supply for the DDR II SDRAM output buffers to provide improved noise immunity. For all current DDR2 unbuffered DIMM designs, VDDQ shares the same power plane as VDD pins.
BA0-BA2	Input	Selects which SDRAM BANK of four is activated.
A0-A13	Input	During a Bank Activate command cycle, Address input defines the row address (RA0-RA13) During a Read or Write command cycle, Address input defines the colum address, In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BA2 defines the bank to be precharged. If AP is low, autoprecharge is disbled. During a precharge command cycle, AP is used in conjunction with BA0-BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0-BA2. If AP is low, BA0, BA1, BA2 are used to define which bank to precharge.
DQ0-DQ63 CB0-CB7	In/Out	Data and Check Bit Input/Output pins.
DM0-DM8	Input	DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
V_{DD},V_{SS}	Supply	Power and ground for DDR2 SDRAM input buffers, and core logic. VDD and VDDQ pins are tied to V_{DD}/V_{DDQ} planes on these modules.
DQS0-DQS8 DQS0-DQS8	In/Out	Data strobe for input and output data. For Rawcards using x16 orginized DRAMs DQ0-7 connect to the LDQS pin of the DRAMs and DQ8-17 connect to the UDQS pin of the DRAM
SA0-SA2	Input	These signals and tied at the system planar to either V_{SS} or V_{DD} to configure the serial SPD EERPOM address range.
SDA	In/Out	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. A resistor must be connected from the SDA bus line to VDD to act as a pullup on the system board.

8.0 Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	Notes
V_{DD}	Voltage on V_{DD} pin relative to V_{SS}	- 1.0 V ~ 2.3 V	V	1
V_{DDQ}	Voltage on V_{DDQ} pin relative to V_{SS}	- 0.5 V ~ 2.3 V	V	1
V_{DDL}	Voltage on V_{DDL} pin relative to V_{SS}	- 0.5 V ~ 2.3 V	V	1
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	- 0.5 V ~ 2.3 V	V	1
T_{STG}	Storage Temperature	-55 to +100	°C	1, 2

Note :
1. Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM.

9.0 AC & DC Operating Conditions

9.1 Recommended DC Operating Conditions (SSTL - 1.8)

Symbol	Parameter	Rating			Units	Notes
		Min.	Typ.	Max.		
V_{DD}	Supply Voltage	1.7	1.8	1.9	V	
V_{DDL}	Supply Voltage for DLL	1.7	1.8	1.9	V	4
V_{DDQ}	Supply Voltage for Output	1.7	1.8	1.9	V	4
V_{REF}	Input Reference Voltage	0.49*V_{DDQ}	0.50*V_{DDQ}	0.51*V_{DDQ}	mV	1,2
V_{TT}	Termination Voltage	V_{REF}-0.04	V_{REF}	V_{REF}+0.04	V	3

Note : There is no specific device V_{DD} supply voltage requirement for SSTL-1.8 compliance. However under all conditions V_{DDQ} must be less than or equal to V_{DD}.
1. The value of V_{REF} may be selected by the user to provide optimum noise margin in the system. Typically the value of V_{REF} is expected to be about 0.5 x V_{DDQ} of the transmitting device and V_{REF} is expected to track variations in V_{DDQ}.
2. Peak to peak AC noise on V_{REF} may not exceed +/-2% V_{REF}(DC).
3. V_{TT} of transmitting device must track V_{REF} of receiving device.
4. AC parameters are measured with V_{DD}, V_{DDQ} and V_{DDL} tied together.

9.2 Operating Temperature Condition

Symbol	Parameter	Rating	Units	Notes
TOPER	Operating Temperature	0 to 95	°C	1, 2

Note :
1. Operating Temperature is the case surface temperature on the center/top side of the DRAM.
2. At 85 - 95 °C operation temperature range, doubling refresh commands in frequency to a 32ms period (tREFI=3.9 us) is required, and to enter to self refresh mode at this temperature range, an EMRS command is required to change internal refresh rate.

9.3 Input DC Logic Level

Symbol	Parameter	Min.	Max.	Units	Notes
V_{IH}(DC)	DC input logic high	V_{REF} + 0.125	V_{DDQ} + 0.3	V	
V_{IL}(DC)	DC input logic low	- 0.3	V_{REF} - 0.125	V	

9.4 Input AC Logic Level

Symbol	Parameter	DDR2-667, DDR2-800		Units	Notes
		Min.	Max.		
V_{IH} (AC)	AC input logic high	V_{REF} + 0.200		V	
V_{IL} (AC)	AC input logic low		V_{REF} - 0.200	V	

9.5 AC Input Test Conditions

Symbol	Condition	Value	Units	Notes
V_{REF}	Input reference voltage	0.5 * V_{DDQ}	V	1
$V_{SWING(MAX)}$	Input signal maximum peak to peak swing	1.0	V	1
SLEW	Input signal minimum slew rate	1.0	V/ns	2, 3

Notes:
1. Input waveform timing is referenced to the input signal crossing through the $V_{IH/IL}$(AC) level applied to the device under test.
2. The input signal minimum slew rate is to be maintained over the range from V_{REF} to V_{IH}(AC) min for rising edges and the range from V_{REF} to V_{IL}(AC) max for falling edges as shown in the below figure.
3. AC timings are referenced with input waveforms switching from V_{IL}(AC) to V_{IH}(AC) on the positive transitions and V_{IH}(AC) to V_{IL}(AC) on the negative transitions.
