1024-BIT(64-WORD BY 16-BIT) ELECTRICALLY ALTERABLE ROM

DESCRIPTION

The M58655P is a serial input/output 1024 bit electrically erasable and reprogrammable ROM organized as 64 words of 16 bits, and fabricated using MNOS technology. Data and addresses are transferred serially via a one-bit bidirectional bus.

FEATURES

- Word-by-word electrically alterable
- Non-volatile data storage 10 years (min)
- Write/erase time 20ms word
- Typical power supply voltages -30V, +5V
- Number of erase-write cycles 10⁵ times (min)
- Number of read access unrefreshed. . . 10⁹ times (min)
- 5V I/O interface

APPLICATION

Non-volatile channel memories for electronic tuning systems and field-reprogrammable read-only memory systems

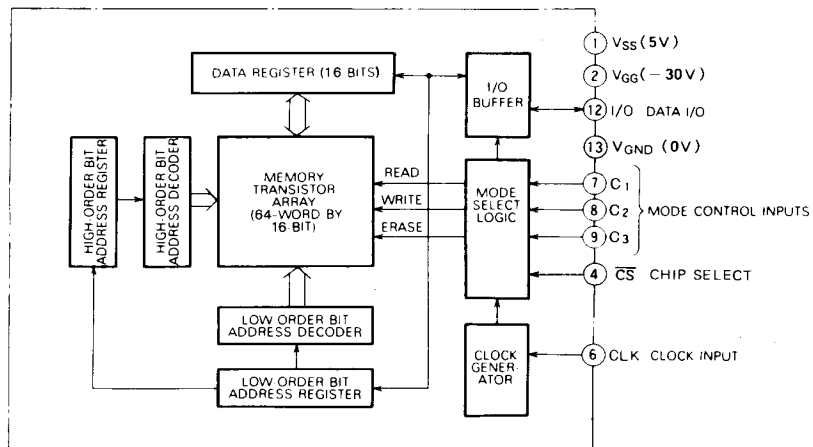

FUNCTION

The address is designated by two consecutive one-of-eight coded digits. Seven modes—accept address, accept data, shift data output, erase, write, read, and standby—are all selected by a 3-bit code applied to C₁, C₂, and C₃. Data is stored by internal negative writing pulses that selectively tunnel charges into the SiO₂-Si₃N₄ interface of the gate insulators of the MNOS memory transistors.

PIN DESCRIPTION

Pin	Name	Functions
I/O	I/O	In the accept address and accept data modes, used for input. In the shift data output mode, used for output. In the standby, read, erase and write modes, this pin is in a floating state.
V _M	Test	Used for testing purposes only. It should be left unconnected during normal operation.
V _{SS}	Chip substrate voltage	Normally connected to +5V.
V _{GG}	Power supply voltage	Normally connected to -30V.
CLK	Clock input	Required for all operating modes, when \overline{CS} is low.
C ₁ C ₃	Mode control input	Used to select the operation mode.
V _{GND}	Ground voltage	Connected to ground (0V).
\overline{CS}	Chip select	Used for chip selection in "L".

OPERATION MODES

C ₁	C ₂	C ₃	Functions
H	H	H	Standby mode. The contents of the address registers and the data register remain unchanged. The output buffer is held in the floating state.
H	H	L	Not used.
H	L	H	Erase mode. The word stored at the addressed location is erased. The data bits after erasing are all low level.
H	L	L	Accept address mode. Data presented at the I/O pin is shifted into the address registers one bit with each clock pulse. The address is designated by two one-of-eight-coded digits. 64-word address is assigned in this mode.
L	H	H	Read mode. The addressed word is read from the memory into the data register.
L	H	L	Shift data output mode. The output driver is enabled and the contents of the data register are shifted to the I/O pin one bit with each clock pulse.
L	L	H	Write mode. The data contained in the data register is written into the location designated by the address registers.
L	L	L	Accept data mode. The data register accepts serial data from the I/O pin one bit with each clock pulse. The address registers remain unchanged.

- Note 4: One or more clock are required for standby between modes.
 5. Set \overline{CS} to the low level after the lapse of t_{ss} and CLK has been set high and $C_1 \sim C_3$ have been set to the standby mode.
 6. Keep CLK to the high level and $C_1 \sim C_3$ to "standby" from the time when \overline{CS} is set high to the lapse of t_{ns} .

Power-on/off Conditions

With power-on, V_{GG} is applied after V_{SS} has been applied.
 With power-off, V_{SS} is cut after V_{GG} has been cut. For power-on and off, hold \overline{CS} in V_{SS} or floating state. The recommended timing chart for power-on and off is as follows.
