

**OCTAL POSITIVE EDGE-TRIGGERED D-TYPE FLIP FLOPS  
 WITH 3-STATE OUTPUTS**

**DESCRIPTION**

The M74LS374P is a semiconductor integrated circuit containing 8 D-type positive edge-triggered flipflop circuits with 3-state output, and is provided with an output control input and a clock input, which are common to all the circuits.

**FEATURES**

- Positive edge triggering
- 3-state, high fan-out output
- The use of pnp transistor input for the output control and clock inputs has made the input load factor small
- The clock input has high noise margin.  
(Hysterisis = 400mV typical)
- Package density is high with 8 circuits in one package
- Provided with output control and clock inputs which are common to all 8 circuits.
- Wide operating temperature range ( $T_a = -20 \sim +75^\circ\text{C}$ )

**APPLICATION**

General purpose, for use in industrial and consumer equipment.

**FUNCTIONAL DESCRIPTION**

Since the 8 D-type ege-triggered flip-flop circuits use a pnp transistor input for the output control input  $\overline{OC}$  and clock input T, which are common to all 8 circuits, the input load factor is small. With a hysteresis of 400mV (typical) specially given to the input circuit T, noise margin is high.

**PIN CONFIGURATION (TOP VIEW)**

When T changes from low to high, the information of data input D immediately before the change appears in the output Q in accordance with the function table.

When  $\overline{OC}$  is high, 1Q – 8Q are all put into the high-impedance state, irrespective of other input signals. Since all outputs have high fan-out, this device is suitable for use as a buffer register, I/O port, or bi-directional bus driver.

**FUNCTION TABLE** (Note 1)

$\overline{OC}$	T	D	Q
L	↑	H	H
L	↑	L	L
L	L	X	$Q^0$
H	X	X	Z

Note 1: ↑ : transition from low to high level

$Q^0$  : level of Q before the indicated steady-state input conditions were established

Z : high-impedance

X : irrelevant
