AlGaAs SPST Non-Reflective PIN Diode Switch

MA4AGSW1A
Rev 2.0

FEATURES

- Ultra Broad Bandwidth: 10 GHz to 50 GHz
- Functional Bandwidth: 100 MHz to 70 GHz
- 1.0 dB Insertion Loss, 35 dB Isolation at 50 GHz
- M/A-COM's unique patent pending AlGaAs hetero-junction anode technology.
- Silicon Nitride Passivation
- Polymide Scratch protection

DESCRIPTION

M/A-COM's MA4AGSW1A is an Aluminum-Gallium Arsenide anode enhanced, SPST Non-Reflective PIN diode switch. AlGaAs anodes, which utilize M/A-COM's patent pending hetero-junction technology, produce less loss than conventional GaAs processes, by as much as a 0.3 dB reduction in insertion loss at 50 GHz. These devices are fabricated on a OMCVD eptaxial wafer using a process designed for high device uniformity and extremely low parasitics. The diodes themselves exhibit lower series resistance, lower capacitance, and faster switching speeds than Silicon based devices. They are fully passivated with silicon nitride and have an additional layer of a polymer for scratch protection. The protective coating prevents damage to the junction and the anode airbridges during handling. Off-chip bias circuitry is required and allows for maximum design flexibility.

APPLICATIONS

The output port of this device (J2), is 50 Ω terminated during Isolation mode, which allows this signal to be absorbed rather than reflected back. This functionality makes it ideal for instrumentation and radar applications. This absorptive switch can be added to available reflective AlGaAs switches to improve isolation VSWR and increase isolation magnitude.

The ultra low capacitance of the PIN diodes makes it ideal for usage in lower loss and higher isolation microwave and millimeter wave switch designs through 70 GHz. The lower series resistance of the AlGaAs diodes reduces the total insertion loss and distortion of the devices. These AlGaAs PIN switches are used as the switching arrays for radar systems, radiometers, and other multi-function components.

ASSEMBLY INSTRUCTIONS

The following precautions should be observed to avoid damaging these chips.

CLEANLINESS

These chips should be handled in a clean environment. Clean die after solder die attach installation with care.

STATIC SENSITIVITY

These Devices are considered ESD Class1. Proper ESD techniques should be used when handling these devices.

GENERAL HANDLING

The protective polymer coating on the active areas of these die provides scratch and impact protection, particularly for the metal air bridge, which contacts the diode's anode. Die should primarily be handled with vacuum pickups, or alternatively with plastic tweezers.

MOUNTING TECHNIQUES

These AlGaAs devices are designed to be mounted with electrically conductive silver epoxy or with a solder that does not excessively scavenge gold.

SOLDER DIE ATTACH

All die attach and bonding methods should be compatible with gold metal. Solders which do not excessively scavenge gold, such as 80Au/20Sn or Sn62/Pb36/Ag2 are acceptable for usage. Do not expose die to a temperature greater than 300 °C for more than 10 seconds.

ELECTRICAL CONDUCTIVE EPOXY DIE ATTACH

Assembly can be preheated to approximately 125°C. Use a controlled thickness of approximately 2 mils for best electrical and thermal conductivity. Cure epoxy as per manufacturer's schedule. For extended cure times, temperatures should be kept below 150°C.

RIBBON/WIRE BONDING

Wedge thermo compression bonding or ball bonding may be used to attach gold ribbons or gold wires to bonding pads. 1 Mil diameter gold wire or 1/4 x 3 mil sq. gold ribbons should be used for all RF ports for lower inductance and best mmwave performance.

Successful Operation of the MA4AGSW1A Switch

One External Bias Network and One External D.C Return is required for successful operation of the MA4AGSW1A Absorptive SPST AlGaAs PIN Diode Switch. The Backside Area of the Die is the RF and D.C. Return Ground Plane. In the Low Loss State, the Series Diode is Forward Biased with -1.35V, - 10 mA, at " D.C. Bias 1 " and the Match Diode is Reverse Biased at -1.35V, 0 mA at " D.C. Bias B ". In the Isolation State, both the Shunt Diode and the Match Diode are Both Forward Biased at + 1.35 V, + 10 mA at " D.C. Bias 1" and " D.C. Bias B ". This Isolation State condition makes the Series Diode Reverse Biased by 1.35V. This Isolation State Results in a Good 50 Ω Match into Port J2 Only. The RF to D.C. Bias Truth table is shown in Table I. The Bias Network Design should yield > 30 dB RF to DC Isolation.
