

MAX14778

Dual $\pm 25V$ Above- and Below-the-Rails 4:1 Analog Multiplexer

General Description

The MAX14778 dual 4:1 analog multiplexer supports analog signals up to $\pm 25V$ with a single 3.0 to 5.5V supply. Each multiplexer has separate control inputs to allow independent switching, making the device ideal for multiplexing different communications signals with the same connector pins. Extended ESD protection of $\pm 6kV$ (Human Body Model) enable direct interfacing to cables and connectors.

The MAX14778 features a low 1.5Ω (max) on-resistance and $3m\Omega$ (typ) flatness to maximize signal integrity over the entire common-mode voltage range. Each multiplexer can carry up to 300mA of continuous current through the multiplexer in either direction.

The MAX14778 supports switching of full-speed USB 1.1 signals (12Mbps) and RS-485 data rates of up to 20Mbps.

The MAX14778 is available in a 20-pin (5mm x 5mm) TQFN package and is specified over the $-40^{\circ}C$ to $+85^{\circ}C$ extended temperature range.

Applications

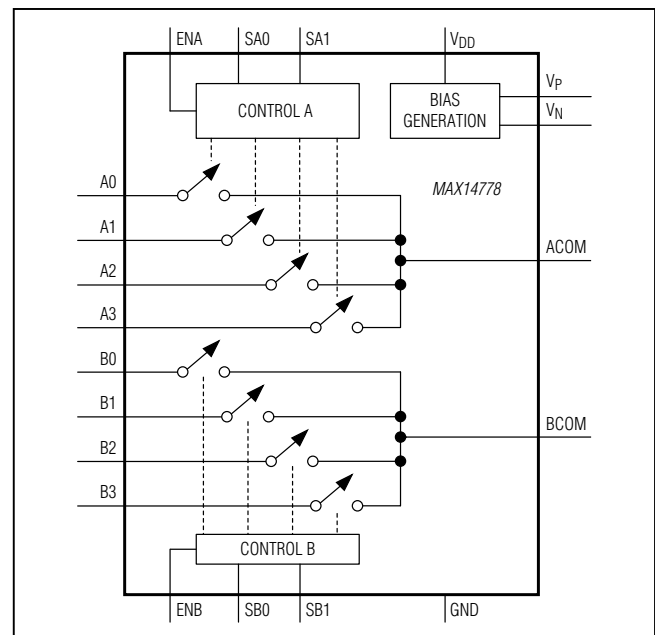

- RS-485/RS-232/USB 1.1 Multiplexing
- POS Peripherals
- Handheld Industrial Devices
- Communication Systems
- Audio/Data Multiplexing
- Connector Sharing
- Gaming Machines

Ordering Information appears at end of data sheet.

Benefits and Features

- Flexible Multiplexer Switches a Wide Array of High-Voltage and Low-Voltage Signals Such as RS485, RS232, and USB 1.1
 - Two Independent Multiplexers
 - Break-Before-Make Operation
 - 1.5Ω R_{ON} (max)
 - $3m\Omega$ R_{ON} Flatness (typ)
 - 300mA Maximum Current Through Multiplexer
 - 78pF Input Capacitance
 - 75MHz Large-Signal Bandwidth
- Ideal for Space-Constrained and Mobile Applications
 - 20-Pin TQFN (5mm x 5mm) Package
- Wide Signal Range Supported from Single-Supply Voltage Eliminates Negative Power Supply
 - $\pm 25V$ Signal Range
 - Single 3.0V to 5.5V Supply
- ESD Protection Circuitry Eliminates Need for External Protection Circuitry
 - Extended ESD Protection on A_ and B_ Pins
 - $\pm 6kV$ Human Body Model (HBM)

Functional Diagram

Absolute Maximum Ratings

(All voltages referenced to GND.)

V_{DD}.....-0.3V to +6V
 V_P.....-0.3V to the lesser of +52V and (V_N + 70V)
 V_N.....The lesser of (V_{DD} - 40V) and (V_P - 70V) to +0.3V
 V_P to V_N.....-0.3V to +70V
 ENA, ENB, SA₋, SB₋.....-0.3V to (V_{DD} + 0.3V)
 A₋, ACOM, B₋,
 BCOM.. (V_N - 0.3V) to the lesser of (V_P + 0.3V) and (V_N + 52V)

Continuous Current Through Switch..... ±500mA
 Continuous Power Dissipation (T_A = +70°C)
 TQFN (derate 33.3mW/°C above +70°C)..... 2666.7mW
 Operating Temperature Range..... -40°C to +85°C
 Junction Temperature+150°C
 Storage Temperature Range..... -65°C to +150°C
 Lead Temperature (soldering, 10s)+300°C
 Soldering Temperature (reflow)+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 1)

TQFN

Junction-to-Ambient Thermal Resistance (θ_{JA})30°C/W
 Junction-to-Case Thermal Resistance (θ_{JC})2°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Electrical Characteristics

(V_{DD} = 3.0V to 5.5V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at V_{DD} = 5V, T_A = +25°C.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
DC CHARACTERISTICS						
Supply Voltage Range	V _{DD}		3.0		5.5	V
Supply Current	I _{DD}	ENA = ENB = high	V _{DD} ≤ V _{DDTH}	4.27	10	mA
			V _{DD} > V _{DDTH}	2.54	6	
		V _{ENA} = V _{ENB} = V _{DD} /2	V _{DD} ≤ V _{DDTH}	4.31	10	
			V _{DD} > V _{DDTH}	2.59	6	
Charge-Pump Threshold	V _{DDTH}	(Note 3)		4.64		V
Analog Signal Range	V _{IN}	Figure 1, switch open or closed	-25		+25	V
Continuous Current Through Switch	I _{COM}		-300		+300	mA
On-Resistance	R _{ON}	Figure 1, I _{COM} = ±300mA, V _{IN} = ±25V		0.84	1.5	Ω
On-Resistance Flatness	R _{FLAT(ON)}	Figure 1, -25V ≤ V _{IN} ≤ +25V, I _{COM} = ±300mA		3		mΩ

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	BCOM	MUX B Common Terminal
2	V_P	Positive Charge-Pump Output. Bypass V_P to GND with a 100nF 50V ceramic capacitor.
3	GND	Ground
4	V_N	Negative Charge-Pump Output. Bypass V_N to GND with a 100nF 50V ceramic capacitor.
5	ACOM	MUX A Common Terminal
6	A0	MUX A Bidirectional Analog Input/Output 0
7	A1	MUX A Bidirectional Analog Input/Output 1
8	A2	MUX A Bidirectional Analog Input/Output 2
9	A3	MUX A Bidirectional Analog Input/Output 3
10	ENA	MUX A Enable Input
11	SA0	MUX A Channel Select Input 0
12	SA1	MUX A Channel Select Input 1
13	V_{DD}	Power-Supply Input. Bypass V_{DD} to GND with a 1 μ F ceramic capacitor.
14	SB1	MUX B Channel Select Input 1
15	SB0	MUX B Channel Select Input 0
16	ENB	MUX B Enable Input
17	B3	MUX B Bidirectional Analog Input/Output 3
18	B2	MUX B Bidirectional Analog Input/Output 2
19	B1	MUX B Bidirectional Analog Input/Output 1
20	B0	MUX B Bidirectional Analog Input/Output 0
—	EP	Exposed Pad. Connect EP to V_N. EP is not intended as an electrical connection point.

Detailed Description

The MAX14778 dual 4:1 analog multiplexer integrates bias circuitry to provide a $\pm 25V$ analog voltage range with a single 3.0 to 5.5V supply. This extended input range allows multiplexing different communications signals such as RS-232, RS-485, audio and USB 1.1 onto the same connector.

Integrated Bias Generation

The MAX14778 contains a total of three charge pumps to generate bias voltages for the internal switches: a 5V regulated charge pump, a positive high-voltage (+35V) charge pump, and a negative high-voltage (-27V) charge pump. When V_{DD} is above 4.7V (typ), the 5V regulated charge pump is bypassed and V_{DD} provides the input for the high-voltage charge pumps, reducing overall supply current.

An external 100nF capacitor is required for each high-voltage charge pump between V_P/V_N and GND.

Analog Signal Levels

The MAX14778 transmits signals of up to $\pm 25V$ with a single 3.0 to 5.5V supply due to integrated bias circuitry. The device features 1.5Ω (max) on-resistance and $3m\Omega$ (typ) flatness for analog signals between -25V and +25V (see the [Typical Operating Characteristics](#)). The current flow through the multiplexers can be bidirectional, allowing operation either as a multiplexer or demultiplexer.

Digital Interface

The MAX14778 has two digital select inputs for each MUX: SA1 and SA0 control MUX A; SB1 and SB0 control MUX B. Drive the digital select inputs high or low to select which input (A_, B_) is connected to the common terminal (ACOM, BCOM) for each MUX. See the [Truth Tables](#) for more information.

Each MUX features an independent enable input (ENA and ENB). Drive ENA or ENB low to disconnect all inputs from the common terminal for that MUX, regardless of the status of the select inputs or the other enable input.

Applications Information

Connector Sharing

The MAX14778 supports a $\pm 25V$ analog signal range independently for each input/output, allowing physical connector sharing between interface types that have differing signal ranges.

The multiprotocol connector-sharing application in the [Typical Operating Circuits](#) shows an application with RS-232, half-duplex RS-485, full-speed USB 1.1, and audio signals sharing the same connector. The device allows signals to pass over the entire signal range specified by each standard while safely isolating the unused transceivers.

Non-Powered Condition

The MAX14778 can tolerate input voltages on the A₋, B₋, ACOM, and BCOM pins in the $\pm 25V$ range when it is not powered.

When VDD = 0V, the DC input leakage current into the A₋, B₋, ACOM or BCOM pins will typically be below 1 μA . Some devices can have a larger leakage current up to mA range due to technology spread.

With VDD not powered, internal diodes between the analog pins and the VP and VN will charge up the external capacitors on VP and VN when positive and/or negative voltages are applied to these pins. This causes transient input current flow.

Large dv/dt on the inputs causes large capacitive charging currents, which have to be limited to the 300mA Absolute Maximum Ratings in order to not destroy the internal diodes. With 100nF capacitors on VP and VN, the dv/dt must be limited to 3V/ μs once the capacitors reach their final voltage; the input current decays to the leakage current levels mentioned above.

High-ESD Protection

Electrostatic discharge (ESD)-protection structures are incorporated on all pins to protect against electrostatic discharges up to $\pm 2kV$ Human Body Model (HBM) encountered during handling and assembly. A₋ and B₋ are further protected against ESD up to $\pm 6kV$ (HBM) without damage. The ESD structures withstand high ESD both in normal operation and when the device is powered down. After an ESD event, the MAX14778 continues to function without latchup.

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

The MAX14778 requires a 100nF capacitor on both Vp and V_N to GND to guarantee full ESD protection.

Human Body Model

Figure 7 shows the Human Body Model. Figure 8 shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest that is then discharged into the device through a 1.5k Ω resistor.
