

CDMA Cellular/PCS System Power Supplies

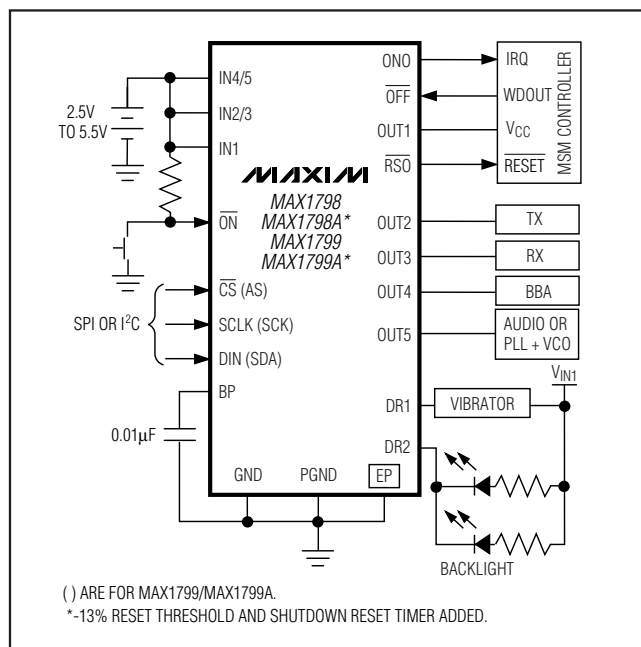

General Description

The MAX1798/MAX1798A/MAX1799/MAX1799A system power supplies are designed specifically for CDMA cellular/PCS handsets. Each device contains five low-dropout linear regulators (LDOs), a 140ms (min) reset timer, a serial interface, push-on/push-off control logic, and two general-purpose open-drain outputs. Only the serial interface is different between the MAX1798/MAX1798A/MAX1799/MAX1799A: the MAX1798/MAX1798A feature an SPI™-compatible serial interface, and the MAX1799/MAX1799A feature an I²C-compatible interface. The "A" parts have a -13% reset threshold, the non-A parts have a 9.5% threshold. The "A" parts have a 175 delay on a reset-triggered shutdown, the non-A shutdown instantly.

Each linear regulator features extremely low dropout voltage, specified at two-thirds of the maximum output current. LDO1 is rated for 300mA, while LDOs 2–5 are each rated for 150mA. All LDOs are optimized for low noise and isolation. Each LDO can be individually enabled and disabled through the serial port, as well as individually programmed to any of 32 voltages from 1.8V to 3.3V.

The MAX1798/MAX1798A/MAX1799/MAX1799As' wide 2.5V to 5.5V input voltage range makes them compatible with a wide range of input supplies, including a single lithium-ion (Li+) cell battery. Both devices are available in thermally-enhanced 20-pin TSSOP and TQFN exposed pad (EP) packages. Evaluation kits in TSSOP (MAX1798EVKIT and MAX1799EVKIT) are available to facilitate designs.

Typical Operating Circuit

Features

- ◆ One 300mA Low-Noise LDO
- ◆ Four 150mA Low-Noise LDOs
- ◆ 45µVRMS Noise from 10Hz to 100kHz
- ◆ >60dB Crosstalk Isolation Below 10kHz
- ◆ >60dB PSRR Below 10kHz
- ◆ 125mV (max) Dropout (OUT1 at 200mA)
- ◆ 100mV (max) Dropout (OUT2–5 at 100mA)
- ◆ Programmable Output Voltages
1.8V to 3.3V in 32 Steps
- ◆ 140ms (min) Reset Timer
- ◆ SPI- or I²C-Compatible Serial Interface
- ◆ Push-On/Push-Off Control Logic
- ◆ Two 150mA General Purpose Open-Drain Outputs
- ◆ Overcurrent and Thermal Protection (all LDOs)
- ◆ 1µA Shutdown Current
- ◆ 20-Pin Thermally-Enhanced TSSOP or TQFN Packages

Applications

CDMA Cellular/PCS Handsets
PDAs, Palmtops, and Handy-Terminals
Single-Cell Li+ Systems
2- or 3-Cell NiMH, NiCd, or Alkaline Systems

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	INTER-FACE
MAX1798ETP+	-40°C to +85°C	20 TQFN	SPI
MAX1798EUP+	-40°C to +85°C	20 TSSOP-EP*	SPI
MAX1798AETP+	-40°C to +85°C	20 TQFN	SPI
MAX1798AEUP+	-40°C to +85°C	20 TSSOP-EP*	SPI

+Denotes a lead(Pb)-free/RoHS-compliant package.

*EP = Exposed pad.

ABSOLUTE MAXIMUM RATINGS

$\overline{\text{OFF}}$, DR1, DR2 to GND.....	-0.3V to +6V	$\overline{\text{RSO}}$	25mA
IN1, IN2/3, IN4/5, DIN (SDA) to GND.....	-0.3V to +6V	Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)	
SCLK (SCK), BP, $\overline{\text{ON}}$ to GND.....	-0.3V to +6V	20-Pin TQFN (derate 33.8mW/ $^\circ\text{C}$ above +70 $^\circ\text{C}$)	2W
$\overline{\text{RSO}}$, ONO to GND.....	-0.3V to ($V_{\text{OUT1}} + 0.3\text{V}$)	20-Pin TSSOP (derate 37.7mW/ $^\circ\text{C}$ above +70 $^\circ\text{C}$)	2W
PGND to GND.....	$\pm 0.3\text{V}$	Operating Temperature Range	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
OUT1, $\overline{\text{CS}}$ (AS) to GND.....	-0.3V to ($V_{\text{IN1}} + 0.3\text{V}$)	Junction Temperature	+150 $^\circ\text{C}$
OUT2, OUT3 to GND.....	-0.3V to ($V_{\text{IN2/3}} + 0.3\text{V}$)	Storage Temperature Range	-65 $^\circ\text{C}$ to +150 $^\circ\text{C}$
OUT4, OUT5 to GND.....	-0.3V to ($V_{\text{IN4/5}} + 0.3\text{V}$)	Lead Temperature (soldering, 10s)	+300 $^\circ\text{C}$
Continuous Sink Current		Soldering Temperature (reflow)	+260 $^\circ\text{C}$
DR1, DR2.....	100mARMS		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

PIN		NAME	FUNCTION
TSSOP	QFN		
1	19	\overline{CS} (AS)	Chip-Select Input for SPI (MAX1798/MAX1798A). Address Select Input for I ² C (MAX1799/MAX1799A).
2	20	SCLK (SCK)	Clock Input for Serial Interface. Data is read on the rising edge of the clock. SCLK for MAX1798/MAX1798A. SCK for MAX1799/MAX1799A.
3	1	DIN (SDA)	Data Input for Serial Interface. Data is read on the rising edge of the clock. DIN for MAX1798/MAX1798A. SDA for MAX1799/MAX1799A.
4	2	ON \overline{O}	On Output. Indicates the state of \overline{ON} . After initial power-up, the logic level of this pin follows that of \overline{ON} . Used to signal the microcontroller (μ C) for an OFF request (allows push-on/push-off).
5	3	GND	Ground
6	4	BP	1.25V Reference Bypass. Connect a 0.01 μ F bypass capacitor to GND for reduced noise. Do not load this pin.
7	5	PGND	Power Ground
8	6	\overline{RSO}	Reset Output. Holds the μ C system reset line low during initial startup and whenever OUT1 falls out of regulation. \overline{RSO} has a 140ms (min) timeout period and is an open-drain output with an internal 14k Ω pullup to OUT1. The \overline{RSO} line maintains a valid low output level for IN1 as low as 1V.
9	7	DR1	2 Ω Open-Drain Driver Output 1. Maximum sink current is 150mA (100mARMS). Can drive up to 10 LEDs for backlight or a vibrator motor.
10	8	DR2	2 Ω Open-Drain Driver Output 2. Maximum sink current is 150mA (100mARMS). Can drive up to 10 LEDs for backlight or a vibrator motor.
11	9	OFF	OFF Input. A low level to this pin when \overline{ON} is high turns off the IC once the watchdog timer has timed out. A high-level input keeps the chip on. There is an internal 155k Ω pulldown resistor at this input.

Detailed Description

The MAX1798/MAX1798A/MAX1799/MAX1799A drive CDMA cellular and PCS handsets or systems with inputs from 2.5V to 5.5V. The devices contain five LDOs, two open-drain outputs, and a reset output as shown in Figure 1. All outputs are individually programmable through either an SPI (MAX1798/MAX1798A) or I²C (MAX1799/MAX1799A) serial-port interface. The outputs may be turned on or off individually through the serial interface. Their output voltages are adjustable from 1.8V to 3.3V in 32 increments. At power-up, all outputs are at a default value of 2.98V, but only OUT1 is on. OUT1 is rated for 300mA and optimized for low dropout. OUT2–5 are rated for 150mA. All LDOs are optimized for low noise, high isolation, and low dropout.

Linear Regulator 1

Regulator 1 is a low-dropout linear regulator that sources 300mA (max), operating from a 2.5V to 5.5V input voltage (V_{IN1}). OUT1 is turned on by using the on button. OUT1 is turned off by using either the off pin or the serial port. Its output can be adjusted from 1.8V to 3.3V from the SPI or I²C serial-port interface by setting the control data byte (Table 1). OUT1 is always on when the MAX1798/MAX1798A/MAX1799/MAX1799A are on. If OUT1 is turned off, the entire IC shuts down. If V_{IN1} falls below 1V, a POR circuit resets all LDO voltages to 2.98V and OUT1 is left on while OUT2–5 are turned off.

Linear Regulators 2–5

Regulators 2–5 are LDOs that source 150mA (max) from input voltages (V_{IN2/3} and V_{IN4/5}) of 2.5V to 5.5V. OUT2–5 can be turned on or off and adjusted from 1.8V to 3.3V through the SPI or I²C serial-port interface by setting the control data byte (Table 1). At power-up,

OUT2–5 are set to 2.98V, but turned off. The control data byte must be used to turn them on. If V_{IN1} falls below 1V, a POR circuit resets all LDO voltages to 2.98V and OUT2–5 are turned off. If V_{IN2/3} or V_{IN4/5} fall below 2.15V, the UVLO circuit turns off the corresponding output, but all LDO voltages remain at their prior settings. OUT2–5 are optimized for low noise and high isolation.

Open-Drain Outputs

The open-drain N-channel MOSFETs (DR1 and DR2, Figure 2) have a nominal 2Ω on-resistance and can be used to drive up to 10 LEDs for backlight or a vibrator motor. DR1 and DR2 can sink 100mA_{RMS} (max). At power-up, DR1 and DR2 are high impedance and are commanded on by the control data byte.

RSO

RSO is an open-drain output, connected to OUT1 through an internal 14kΩ resistor. At power-up, OUT1 turns on and RSO is held low for 140ms (min). When RSO goes high, OFF must be brought high within 35ms to keep OUT1 on. Otherwise, if OFF is low, the watchdog timer circuit counts down 35ms (min), and RSO is actively held low while the entire device turns off.

The MAX1798/MAX1799 RSO goes low when OUT1 droops by more than 7.5% ±2% of its programmed output voltage. The MAX1798A/MAX1799A RSO goes low when OUT1 droops by more than 13% ±2% of its programmed output voltage. RSO stays low for 140ms (min) after OUT1 rises above the threshold. During this time, the watchdog timer circuit is inactive.

The MAX1798A/MAX1799A have an additional timer circuit to shut down the regulators when the RSO and watchdog timer time out. If the OUT1 voltage level ever exceeds the RSO threshold level before the reset and

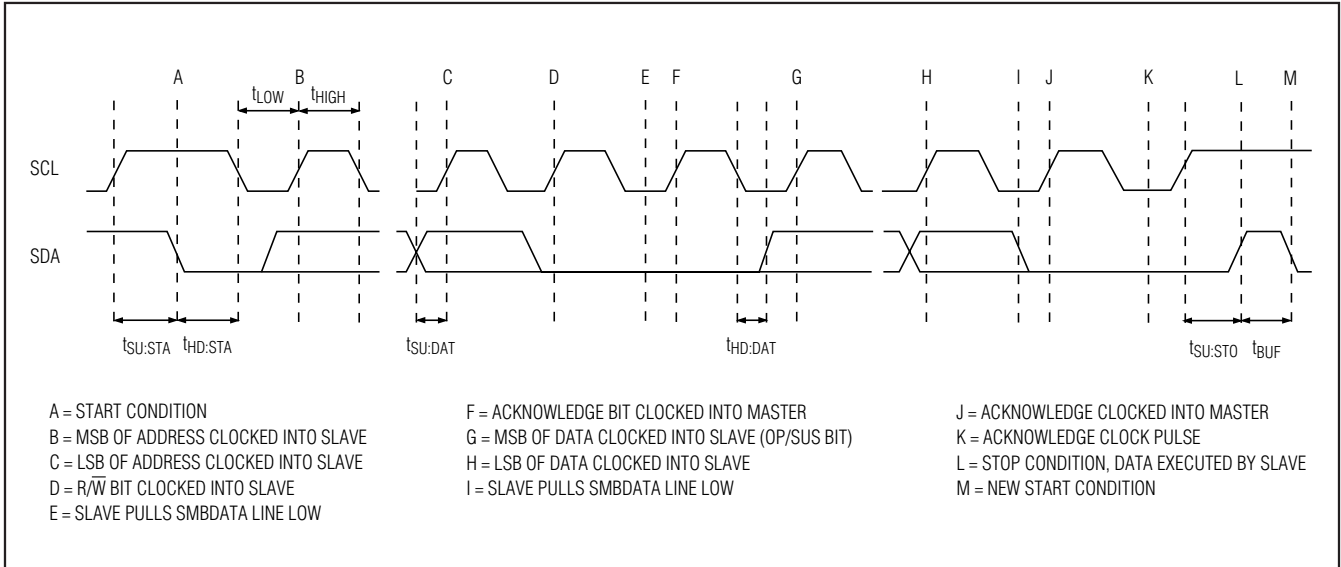

Figure 2. I²C-Compatible Serial-Interface Timing Diagram

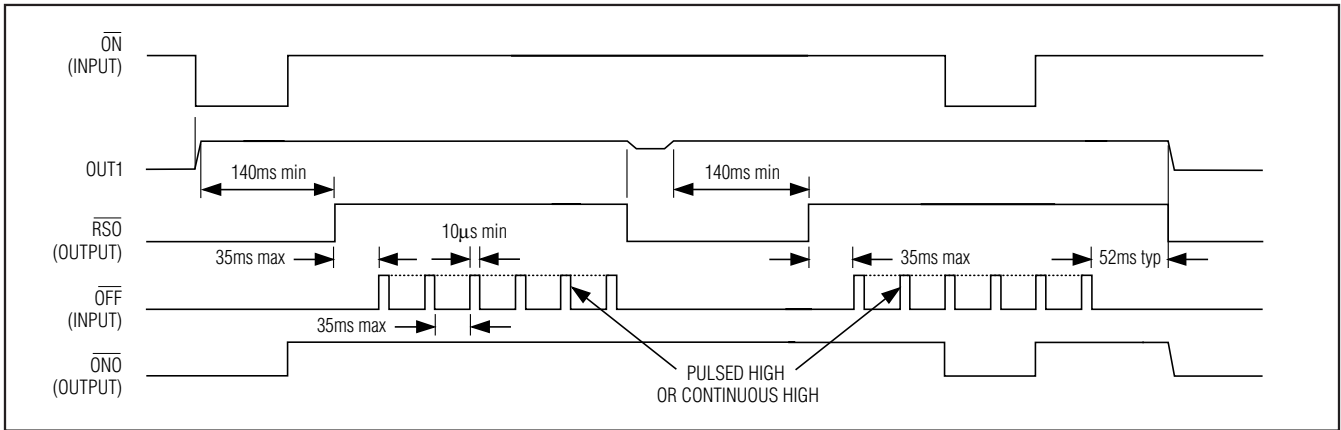

Figure 3. Push-On/Push-Off Startup and Shutdown Timing Diagram

watchdog timers time out, the shutdown timer is reset. The shutdown timer requires continuous low \overline{RSO} signal and continuous nontriggered watchdog timer to shut down the regulators.

\overline{ON} and \overline{OFF} Logic

See Figure 3. The MAX1798/MAX1798A/MAX1799/MAX1799A power up when V_{IN1} is greater than 2.5V and \overline{ON} is low (\overline{ON} button is pressed momentarily). When \overline{ON} returns high, the device remains on. It turns on $OUT1$ and the serial interface port. Once $OUT1$ is in regulation, \overline{RSO} stays low an additional

140ms (min). At this time, $OUT1$ is on and set to 2.98V, while $OUT2-5$ are disabled and set to 2.98V. To stay on, the \overline{OFF} pin must be in a high state within 35ms (min) or the device will shut down and can only be turned on by pressing the \overline{ON} button. While \overline{ON} is held low, the status of \overline{OFF} is irrelevant and $OUT1$ and the serial port are on.

After initial power-up, the logic level of \overline{ONO} follows the logic level of \overline{ON} but is level-shifted to $OUT1$ high voltage. This signal can be used to interrupt the system controller, which can subsequently manage an orderly shutdown through the serial port by turning off $OUT1$.

CDMA Cellular/PCS System Power Supplies

Hard Shutdown

To shut down the MAX1798/MAX1798A/MAX1799/MAX1799A, drive $\overline{\text{OFF}}$ low or allow the internal resistor to pull down $\overline{\text{OFF}}$ while $\overline{\text{ON}}$ is high. The device shuts down after the watchdog timer has cleared (35ms min, 52ms typ). During shutdown, all LDO outputs and $\overline{\text{RSO}}$ are actively pulled to GND, the open-drain drivers are in a high-impedance state, and the serial port and reset timer are inactive. Previously programmed output voltage data is retained in the internal registers as long as $V_{\text{IN1}} > 2.1\text{V}$. If the device is turned back on by the $\overline{\text{ON}}$ button, OUT1 automatically is enabled with the preshutdown output voltage. OUT2–5 automatically return to their preshutdown voltages once they are enabled through the serial interface.

Soft Shutdown

The serial port can also be used to shut down the MAX1798/MAX1798A/MAX1799/MAX1799A. Using the control data byte to disable OUT1 will shut down the entire device. Once shut down, the only means to turn on the device is through a momentary low on the $\overline{\text{ON}}$ button.

Control Data Byte

The control data byte is 8 bits long (3 command bits and 5 data bits). The first 3 bits specify the action to be taken, while the last 5 bits set the output voltage or ON/OFF status. Each regulator has an individual DAC that sets the output voltage. The DAC registers are double buffered to allow for simultaneous updating of all outputs. The output voltage is programmed per Table 2 or Table 3. At power-up, if no specific voltage is programmed, OUT1–5 will be set for 2.98V. All DAC programming must be shifted from the double buffer to the DACs with the update DAC command (Table 1, 000XXXXX) for the programmed voltages to be seen at the LDO outputs. The DACs can be updated one at a time or all at once after all desired outputs are programmed. The ON/OFF status of the LDOs and drivers is not double-buffered and takes immediate effect upon $\overline{\text{CS}}$ returning high (SPI compatible) or upon the ninth rising edge of SCK during the command byte (Figure 2, edge L). A one turns on the LDO output or driver output, and a zero turns it off.

SPI-Compatible Serial Interface

Use an SPI-compatible 3-wire serial interface with the MAX1798/MAX1798A to control the ON/OFF state and output voltage of each regulator, the ON/OFF state of the drivers, and to shut down the device. Figures 4a and 4b are timing diagrams for the SPI protocol. The MAX1798/MAX1798A is a write-only device and uses

$\overline{\text{CS}}$ along with SCLK and DIN to communicate. The serial port operates when the device is enabled, even when $\overline{\text{RSO}}$ is low. The MAX1798/MAX1798A can support a 2MHz (max) data rate. This SPI-compatible port uses the CPOL = CPHA = 0 protocol.

I²C-Compatible Serial Interface

Use an I²C-compatible 2-wire serial interface with the MAX1799/MAX1799A to control the ON/OFF state and output voltage of each regulator, the ON/OFF state of the drivers, and to shut down the device. Use standard I²C-compatible write-byte commands to program the IC. Figure 2 is a timing diagram for the I²C protocol. The MAX1799/MAX1799A is always a slave to the bus master. The serial port operates when the device is enabled, even when OUT1 and $\overline{\text{RSO}}$ are low. When AS is high, the address is 0111111. When AS is low, the address is 1001111. Two MAX1799/MAX1799A devices can be controlled by a single bus master.

Output Voltage

The MAX1798/MAX1798A/MAX1799/MAX1799A are supplied with factory-set output voltages. At power-up, all DACS are set for 2.98V, while only OUT1 is enabled; all other LDO outputs and drivers are off. OUT2–5, DR1, and DR2 must be enabled on with the serial port. OUT2–5 can be individually programmed through the serial port from 1.8V to 3.3V in 32 steps, either while on or off. OUT1 can be programmed in 32 steps from 1.8V to 3.3V only while on. (If OUT1 is off, the serial port is also off, and OUT1 cannot be programmed.) If OUT1 is turned off through the serial port or the $\overline{\text{OFF}}$ pin, the entire chip, including the serial port, will be shut down. However, all previously programmed DAC settings will be retained as long as a valid supply voltage is maintained on IN1 ($V_{\text{IN1}} > 2.1\text{V}$).

Current Limit

The MAX1798/MAX1798A/MAX1799/MAX1799A include current limiting on each LDO output. OUT1 has a current limit set at 500mA (320mA min), while OUT2–5 have current limits set at 250mA (160mA min). When the LDO output is in current limit, the current-limiter device monitors and controls the pass transistor's gate voltage, limiting the output current available from the LDO. Once the excessive load is removed, normal function resumes automatically.

MAX1798/MAX1798A/MAX1799/MAX1799A

CDMA Cellular/PCS System Power Supplies

Figure 4a. Serial-Interface Timing Diagram

Figure 4b. Detailed Serial-Interface Timing Diagram

Thermal-Overload Protection

The MAX1798/MAX1798A/MAX1799/MAX1799A integrate a separate thermal monitor for each linear regulator. When the junction temperature of any LDO exceeds $T_J = +160^\circ\text{C}$, the specific thermal sensor signals the shutdown logic, turning off the pass transistor and allowing that LDO to cool. The thermal sensor turns the pass transistor on again after the LDO's junction temperature cools by 10°C , resulting in a pulsed output during continuous thermal-overload conditions. Due to the substrate's thermal conductivity, a thermal overload on one LDO may possibly affect other LDOs on the device.

Thermal-overload protection is designed to protect the MAX1798/MAX1798A/MAX1799/MAX1799A in the event of fault conditions. For continual operation, do not exceed the absolute maximum junction-temperature rating of $T_J = +150^\circ\text{C}$.

Noise Reduction

Bypass BP to GND with an external $0.01\mu\text{F}$ bypass capacitor. The MAX1798/MAX1798A/MAX1799/MAX1799A exhibit $45\mu\text{V}_{\text{RMS}}$ of output voltage noise. Graphs of Output Noise vs. Load Current, Output Noise (10Hz to 100kHz), PSRR vs. Frequency, and Channel-to-Channel Isolation vs. Frequency appear in the *Typical Operating Characteristics*.

CDMA Cellular/PCS System Power Supplies

MAX1798/MAX1798A/MAX1799/MAX1799A

Applications Information

Capacitor Selection and Regulator Stability

Use a 10 μ F low-ESR ceramic capacitor on the MAX1798/MAX1798A/MAX1799/MAX1799A's input if all the supply inputs are connected together. Larger input capacitance and lower ESR provide better supply noise rejection and line-transient response. If IN1, IN2/3, and IN4/5 are connected to different supply voltages, bypass each input with a 4.7 μ F low-ESR ceramic capacitor.

A minimum 4.7 μ F low-ESR ceramic capacitor is recommended on OUT1, and a minimum 2.2 μ F low-ESR ceramic capacitor is recommended on OUT2–5. The MAX1798/MAX1798A/MAX1799/MAX1799A are stable with output capacitors in the ESR range of 10m Ω to 1 Ω . Use larger capacitors to reduce noise and improve load-transient response, stability, and power-supply rejection.

Note that some ceramic dielectrics exhibit large capacitance and ESR variation with temperature. With dielectrics such as Z5U and Y5V, it may be necessary to use a minimum 4.7 μ F on OUT2–5 to ensure stability at temperatures below -10°C. With X7R or X5R dielectrics, 2.2 μ F should be sufficient at all operating temperatures. Tantalum capacitors may cause instability with the MAX1798/MAX1798A/MAX1799/MAX1799A and are not recommended for this application.

Use a 0.01 μ F bypass capacitor at BP for low output-voltage noise. Increasing the capacitance will slightly decrease the output noise but will increase the startup time. Values above 0.1 μ F provide no performance advantage and are not recommended.

Line-Transient Considerations

The MAX1798/MAX1798A/MAX1799/MAX1799A are designed to deliver low dropout voltages and low quiescent currents in battery-powered systems. Power-supply rejection is >60dB at low frequencies and rolls off above 10kHz. See the Power-Supply Rejection Ratio (PSRR) vs. Frequency graph in the *Typical Operating Characteristics*.

When operating from sources other than batteries, improved supply noise rejection and transient response can be achieved by increasing the values of the input and output bypass capacitors and through passive filtering techniques. The *Typical Operating Characteristics* show the MAX1798/MAX1798A/MAX1799/MAX1799A line- and load-transient responses.

Load-Transient Considerations

The MAX1798/MAX1798A/MAX1799/MAX1799A load-transient response graphs (see *Typical Operating Characteristics*) show three components of the output response: the output capacitor's ESR spike, the regulator's transient settling response, and the DC shift due to the LDO's load regulation. Increasing the output capacitor's value and decreasing the ESR reduce the overshoot.

Dropout Voltage

A regulator's minimum input-output voltage differential (dropout voltage) determines the lowest usable supply voltage. In battery-powered systems, this determines the useful end-of-life battery voltage. Because the MAX1798/MAX1798A/MAX1799/MAX1799A use P-channel MOSFET pass transistors, their dropout voltage is a function of drain-to-source on-resistance ($R_{DS(ON)}$) multiplied by the load current. See the Dropout Voltage (OUT1) vs. Load Current graph in the *Typical Operating Characteristics*.
