MUX Switch for USB Type-C Audio Adapter Accessories

General Description

The MAX20328/MAX20328A are USB Type-C audio interface ICs for use in portable devices. As USB Type-C and USB power delivery (PD) make a high-voltage charging solution readily available, the data and SBU lines are at risk of shorting to a high bus voltage, risking permanent damage to the portable device. USB 2.0 data lines also need protection when multiplexed with analog audio signals that vary from positive to negative voltages. The devices can detect a CC pin connection event to disable the microphone bias and eliminate pop up noise when an audio accessory is attached.

The MAX20328/MAX20328A come in a 5 x 5 array, 25-bump, 0.4mm pitch, 2.34mm x 2.34mm wafer-level package (WLP).

Applications

- Smart Phones
- Phablets
- Tablet PCs

Benefits and Features

- Versatile and Flexible Switch Configurations
 - High-Speed USB Data or Audio Switch Paths
 - Automatic Impedance Detection in Audio Configurations
 - Full Manual Switch Control
 - Beyond-the-Rails™ Signal Capability
- Overvoltage Protected Data and Audio Channels
 Two Separate OVLO Blocks
 - OVLO Threshold Programmable to 3.37V, 4.00V, 4.70V, or 5.00V
- Negative Voltage Capable Audio Channel
 - ±5V Audio Signals (Limited by Positive OVLO Threshold)
 - -100dB THD+N
 - -100dB PSRR at 217Hz
- High ESD and Surge-Protected USB Type-C Contacts
 ±12kV HBM
 - ±25V Surge Capable on USB Type-C Pins
- Minimal Solution size
 - 5 x 5 Array, 0.4mm Pitch 2.34mm x 2.34mm WLP

Ordering Information appears at end of data sheet.

Beyond-the-Rails is a trademark of Maxim Integrated Products, Inc.

Package Thermal Characteristics (Note 2)

WLP

Note 2: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Block Diagram (continued)

MUX Switch for USB Type-C Audio Adapter Accessories

Detailed Description

The MAX20328/MAX20328A are USB Type-C audio interface and protection ICs for use in portable devices. As USB power delivery makes a high-voltage charging solution readily available on Type-C connectors, the data and SBU lines are at risk of shorting to a high bus voltage, causing permanent damage to the portable device.

The MAX20328/MAX20328A route incoming signals through the USB Type-C data path or audio path based on information received from a Type-C controller IC or the application processor (AP) controller. The devices offer

automatic microphone orientation and impedance detection for audio devices, pop-up noise suppression, and surge protection on pins connected directly to the USB Type-C port.

Operation

All switches are open until the MAX20328/MAX20328A are enabled. To enable the devices, write the EN bit (0x06[4]) high. Once enabled, the switches default to the behaviors selected by the MODE[2:0] bits (0x06[2:0]) in automatic mode. See <u>Table 1</u> and <u>Table 2</u> for the switch configurations of each MODE[2:0] setting.

MUX Switch for USB Type-C Audio Adapter Accessories

Enable

Both the MAX20328 and MAX20328A are enabled by default (EN = 1). To disable a device, write EN = 0 (0x06[4] = 0). In the disable state, all switches are open and the devices enter a low-current mode to minimize the

supply current. When a device is disabled, the ADC_VAL register (0x01) and bits 0x02[7:6] and 0x02[3:0] are reset to 0. These bits provide information regarding the audio accessory impedance and microphone orientation. When EN is set to 1, the device runs through the state machine diagrammed in Figure 1.

Figure 1. Startup State Machine (FSM)

MUX Switch for USB Type-C Audio Adapter Accessories

Pop-Up Noise Suppression

If a 3.5mm jack is removed from a USB Type-C audio adapter when the adapter is connected to a portable device, pop-up noise may be heard due to the MIC line bias. When the CC pin goes high to signal an audio accessory removal, the MIC/AGND and AGND/MIC switches disconnect from the MIC bias and discharge to ground within 50µs.

Impedance Detection

The MAX20328/MAX20328A can perform an impedance detection to measure the impedance of a connected audio accessory or detect an open cable. This function uses a precision, 8-bit ADC to measure the voltage dropped across the left audio channel while the IDET current source is active. An impedance measurement triggers automatically when EN is set to 1 if ADC_CTL[1:0] = 11 and follows the state machine in Figure 1. Changing MODE[2:0] to 1xx while the device is enabled also trig-

gers an automatic measurement. If ADC_CTL[1:0] = 01 or 10, impedance measurements are manually triggered by writing FORCE_ADC_START high.

When OPEN_DETECT = 1 (0x09[5]), the impedance detection starts with IDET = 100μ A. Otherwise, the 1.1mA and 5.5mA current sources are used for low impedance detection. Figure 2 details the impedance detection process.

Current Sources

Three current source values are available for impedance detection. For high impedance audio accessories and open cable detection, a 100 μ A source is used. When the accessory impedance is low, i.e. ADC_VAL < HIHS_VAL after EOC goes high, IDET switches to 1.1mA. For very low impedance accessories, the 1.1mA source increases to 5.5mA. The value of the current source used in the latest impedance measurement is available in SET_IDET[1:0] (0x09[3:2]).

Figure 2.Impedance Detection Process

ADC Result

When the EOC bit goes high, the ADC result is available in ADC_VAL (register 0x01). The following conversion extracts the channel impedance from ADC_VAL and SET_IDET[1:0]

R = (ADC_VAL[7:0] x 4.746mV) / SET_IDET[1:0]

To account for potential offsets in the ADC and current source values, <u>Table 3</u> provides the minimum and maximum values the ADC may provide for common headset impedance values.

Open Cable Check

The MAX20328/MAX20328A can perform an open cable check during the impedance measurement. If the 100μ A current source detects a high impedance where ADC_VAL > HIHS_VAL, the OPEN_CABLE bit (0x02[3]) goes high to signal the open cable.

MIC/GND Detection

Because a USB Type-C audio accessory can be inserted in two orientations, it is necessary to identify the MIC and GND lines. After an impedance detection, the state machine determines if the MIC/AGND switches are in the correct orientations. If ADC_VAL is greater than the thresholds set in OMTP_VAL or HIHS_VAL, the switch positions are swapped and the impedance measurement is repeated.

MUX Switch for USB Type-C Audio Adapter Accessories

In cases where the 3.5mm to USB Type-C adapter has a non-standard internal connection of one SBU to ground, there is the potential risk for the MIC line to be shorted to ground. To prevent this situation, the MAX20328/MAX20328A can check for the presence of a bias on the MIC line at the end of an automatic impedance detection. When MIC_CHK_DIS = 0 (0x07[1]), the devices check for a bias greater than MIC_{THR} on the MIC line. If no bias is detected, the states of the MIC/AGND switches are swapped immediately after the DEVICE_ READY bit goes high. To prevent the bias check from incorrectly reassigning the switches, a bias voltage must be applied to MIC before running an impedance detection.

I²C Interface

The MAX20328/MAX20328A use the two-wire I2C interface to communicate with a host application processor. The configuration settings and status information provided through this interface are detailed in the register descriptions (Tables 5 - 19). Both devices use the sevenbit slave address 0b0010101 (0x2A for writes, 0x2B for reads).

Applications Information

Applying Signals to an Open Switch

Due to the structure of the DP_/DM_ inputs, the switches will not close when a large, high frequency signal is applied to the open terminal. To ensure the desired path closes properly, avoid applying fast signals >1V to the DP /DM pins before closing the switch.

ACCESSORY IMPEDANCE (Ω)	RESISTOR	RESISTOR RANGE (Ω)		DE (HEX)	SET_ID	SET_IDET[1:0]

Table 3. ADC to Impedance Range Conversion Guide

MUX Switch for USB Type-C Audio Adapter Accessories

I²C Serial Interface

The I²C serial interface is used to configure the device. Figure 3 shows the I²C timing diagram.

Serial Addressing

When in I²C mode, the devices operate as slave devices that send and receive data through an I²C-compatible 2-wire interface. The interface uses a serial data line (SDA) and a serial-clock line (SCL) to achieve bidirectional communication between master(s) and slave(s). A master (typically a microcontroller) initiates all data transfers to and from the MAX20328/MAX20328A and generates the SCL clock that synchronizes the data transfer. The SDA line operates as both an input and an open drain output. A pullup resistor is required on SDA. The SCL line operates only as an input. A pullup resistor is required on SCL if there are multiple masters on

the 2-wire interface, or if the master in a single-master system has an open drain SCL output. Each transmission consists of a START condition sent by a master, followed by the MAX20328/MAX20328A 7-bit slave address plus R/W bit, a register address byte, one or more data bytes, and finally a STOP condition.

Start and Stop Conditions

Both SCL and SDA remain high when the interface is not busy. A master signals the beginning of a transmission with a START (S) condition by transitioning SDA from high to low while SCL is high (Figure 4). When the master has finished communicating with the slave, it issues a STOP (P) condition by transitioning SDA from low to high while SCL is high. The bus is then free for another transmission.

Figure 3. I²C Timing Diagram.

Figure 4. Start and Stop Conditions

Bit Transfer

One data bit is transferred during each clock pulse (Figure 5). The data on SDA must remain stable while SCL is high.

Acknowledge

The acknowledge bit is a clocked 9th bit (Figure 6), which the recipient uses to handshake receipt of each byte of data. Thus, each byte transferred effectively requires 9 bits. The master generates the 9th clock pulse, and the recipient pulls down SDA during the acknowledge clock pulse. The SDA line is stable low during the high period of the clock pulse. When the master is transmitting to the devices, it generates the acknowledge bit because the device is the recipient. When the device is transmitting to the master, the master generates the acknowledge bit because the master is the recipient. If the device does not pull SDA low, a not acknowledge is indicated.

Slave Address

The devices have a 7-bit slave address. The bit following a 7-bit slave address is the R/\overline{W} bit, which is low for a write command and high for a read command. The slave address for the device is 0b00101011 for read commands and 0b00101010 for write commands. This is summarized in Table 4.

Table 4. I²C Slave Addresses

	VALUE				
ADDRESS FORMAI	HEX	BINARY			
7-BIT SLAVE ADDRESS	0x15	001 0101			
WRITE ADDRESS	0x2A	0010 1010			
READ ADDRESS	0x2B	0010 1011			

Figure 5. Bit Transfer

Figure 6. Acknowledge

MUX Switch for USB Type-C Audio Adapter Accessories

Bus Reset

The MAX20328/MAX20328A resets the bus with the I²C start condition for reads. When the R/\overline{W} bit is set to 1, the MAX20328/MAX20328A transmits data to the master, thus the master is reading from the device.

Format for Writing

A write to the devices comprises the transmission of the slave address with the R/W bit set to zero, followed by at least 1 byte of information. The first byte of information is the register address or command byte. The register address determines which register of the device is to be written by the next byte, if received. If a STOP (P) condition is detected after the register address is received, then the device takes no further action beyond storing the register address. Any bytes received after the register address are data bytes. The first data byte goes into the register selected by the register address and subsequent

data bytes go into subsequent registers (Figure 7). If multiple data bytes are transmitted before a STOP condition, these bytes are stored in subsequent registers because the register addresses auto-increments (Figure 8).

Format for Reading

The MAX20328/MAX20328A is read using the internally stored register address as an address pointer, the same way the stored register address is used as an address pointer for a write. The pointer auto-increments after each data byte is read using the same rules as for a write. Thus, a read is initiated by first configuring the register address by performing a write (Figure 9). The master can now read consecutive bytes from the device, with the first data byte being read from the register address (Figure 10). Once the master sounds a NACK, the MAX20328/MAX20328A stop sending valid data.

RESET MAX20328	0	0	1	1	0	0	1	1		
RESET MAX20328A	0	0	1	1	0	0	1	1		
IDET_FLAT	IDET Flat Sets the le 0 = 25ms 1 = 100ms	Period ength of time II s	DET remains fla	at.		·				
MG_CHK_DIS	MIC/GND Disables a 0 = Perfor 1 = Disabl	MIC/GND Position Detection Disable Disables automatic MIC/GND orientation detection when an audio accessory is connected. 0 = Perform automatic MIC/GND position detection 1 = Disable automatic MIC/GND position detection								
OPEN_ DETECT	Open Cable Detection Enable Enables the 100µA current source to detect a high impedance or open cable. 0 = Open cable check disabled 1 = Open cable check enabled									
ADC_LI_CHK	Low Impedance Detection Enable Enables the 1.1 and 5.5mA current sources for audio accessory low impedance detection. 0 = Low impedance detection disabled 1 = Low impedance detection enabled									
SET_IDET[1:0]	Manual IDET Setting Set the IDET level to be used in an impedance check triggered by FORCE_ADC_START (0x0A[0]). 00 = 100µA 01 = 100µA 10 = 1.1mA 11 = 5.5mA									
ADC_CTL[1:0]	ADC Conversion Control Configures when the ADC performs an impedance detection. 00 = ADC and impedance detection are always off 01 = Manual impedance detection performed with a single ADC measurement triggered by FORCE_ADC_ START. 10 = Manual impedance detection performed with multiple averaged ADC measurements triggered by FORCE_ ADC_START. Set the number of ADC samples to average with ADC_AVG#[1:0] (0x0A[3:2]). 11 = Impedance detection follows FSM. See Figure 1.

SET_OVTH1 [1:0]	Data/Audi Set the O 00 = 3.37' 01 = 4.0V 10 = 4.7V 11 = 5.0V	Data/Audio Switch Overvoltage Threshold Set the OVP threshold on the DM_ and DP_ switch paths. 00 = 3.37V 01 = 4.0V 10 = 4.7V 11 = 5.0V								
SET_OVTH2 [1:0]	SBU_/GSNS_Switch Overvoltage Threshold Set the OVP threshold on the SBU_ and GSNS_ switch paths. 00 = 3.37V 01 = 4.0V 10 = 4.7V 11 = 5.0V									
ADC_AVG# [1:0]	ADC Number of Samples Sets the number of ADC samples to average. 00 = 2 samples 01 = 4 samples 10 = 8 samples 11 = 16 samples									
OVP_LATCH_ OFF	OVP Latch Reset Restores the previous state of switches after an OVP event. Only active when MANUAL_OVP_RESTORE = 1 (0x06[3]). 0 = No effect 1 = Switches restored to previous state									
FORCE_ADC_ START	Force ADC Conversion Manually trigger an ADC impedance measurement when ADC_CTL[1:0] = 01 or 10. 0 = ADC operates normally 1 = Begin ADC conversion. Sets EOC upon completion (0x02[0]).
