■ HANDLING DEVICES

Preventing Latchup

A latchup can occur if, on this device, (a) a voltage higher than V_{DD} or a voltage lower than V_{SS} is applied to an input or output pin or (b) a voltage higher than the rating is applied between V_{DD} and V_{SS}. The latchup, if it occurs, significantly increases the power supply current and may cause thermal destruction of an element. When you use this device, be very careful not to exceed the maximum rating.

Handling unused pins

Do not leave an unused input pin open, since it may cause a malfunction. Handle by, using a pull-up or pull-down resistor.

Unused output pin should be opened.

The attention when the external clock is used

Input the clock to XIN pin, and XOUT pin should be opened when you use the external clock.
Please pay attention so that an overshoot and an undershoot do not occur to an input clock of XIN pin.

Power supply pins

Please design connecting the power supply pin of this device by as low impedance as possible from the current supply source.

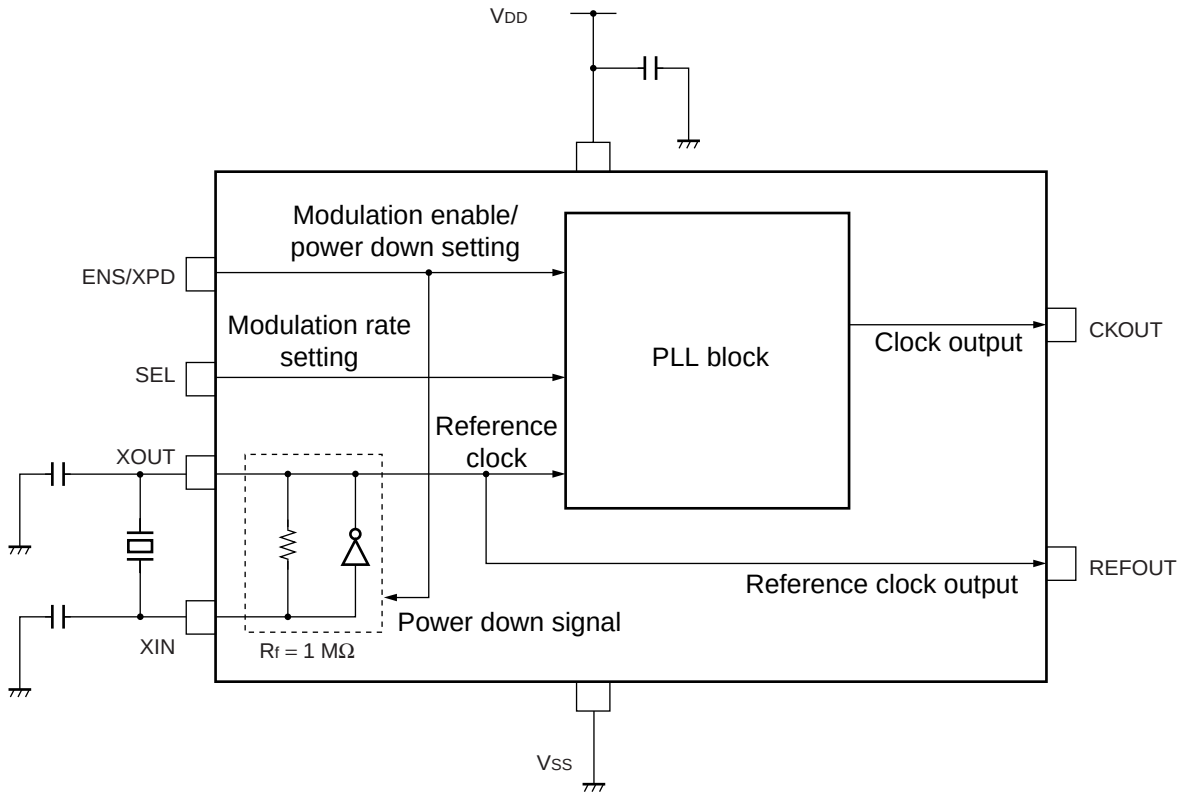
We recommend connecting electrolytic capacitor (about 10 μF) and the ceramic capacitor (about 0.01 μF) in parallel between V_{SS} and V_{DD} near the device, as a bypass capacitor.

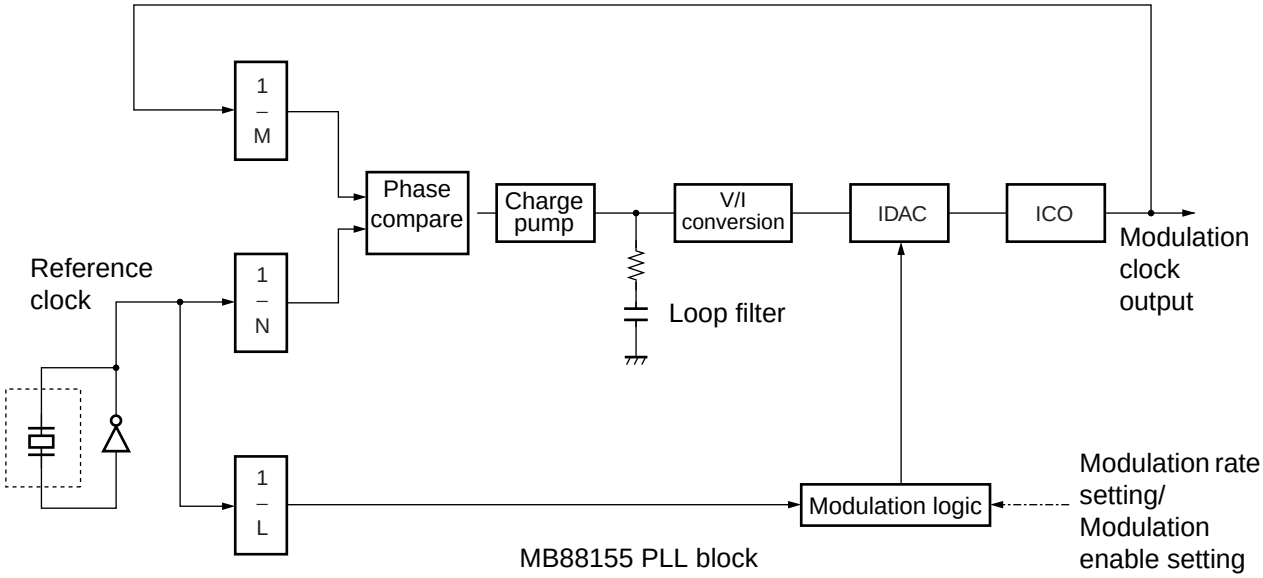
Oscillation circuit

Noise near the XIN and XOUT pins may cause the device to malfunction. Design printed circuit boards so that electric wiring of XIN or XOUT pin and the resonator do not intersect other wiring.

Design the printed circuit board that surrounds the XIN and XOUT pins with ground.

■ BLOCK DIAGRAM





A glitchless IDAC (current output D/A converter) provides precise modulation, thereby dramatically reducing EMI.

■ PIN SETTING

The modulation clock requires stabilization wait time after the PIN setting is changed. For the modulation clock stabilization wait time, assure the maximum value for “Lock-up time” in the AC Characteristics list in “■ ELECTRICAL CHARACTERISTICS”.

ENS modulation enable setting

ENS	Modulation	
L	No modulation	MB88155-xx0, xx1
H	Modulation	

Note : Spectrum does not diffuse when “L” is set to ENS pin.
MB88155-xx2, xx3 do not have ENS pin.

XPD power down

XPD	Status	
L	Power down status	MB88155-xx2, xx3
H	Operating status	

Note : When setting “L” to XPD pin, it becomes power down mode (low power consumption mode) .
Both CKOUT and REFOUT of output pins are fixed to “L” output during power down.
MB88155-xx0, xx1 do not have XPD pin.

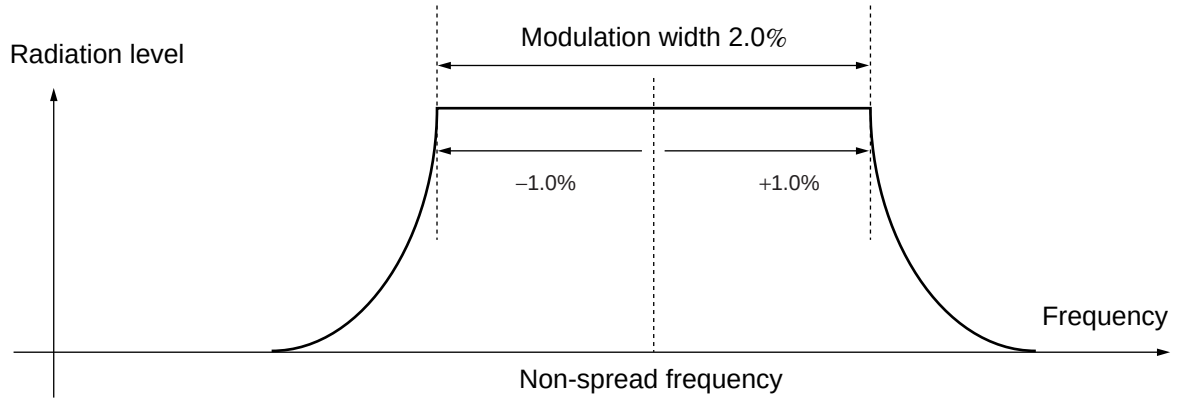
SEL modulation rate setting

SEL	Frequency	
L	± 0.5%	MB88155-x1x
	– 1.0%	MB88155-x0x
H	± 1.0%	MB88155-x1x
	– 2.0%	MB88155-x0x

Note : The modulation rate can be changed at the level of the pin.

• Center spread

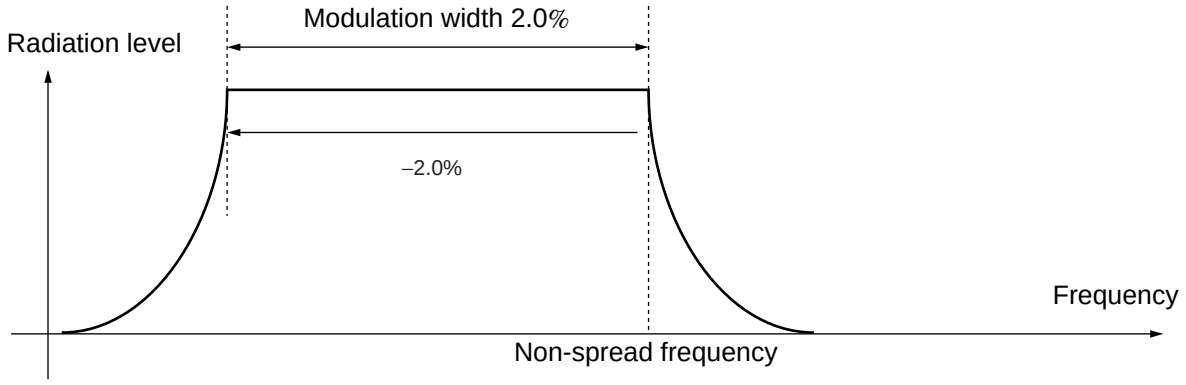
Spectrum is spread (modulated) by centering on the non-spread frequency.



Example of center spread at modulation rate ± 1.0%

• Down spread

Spectrum is spread (modulated) below the non-spread frequency.



Example of down spread at modulation rate – 2.0%

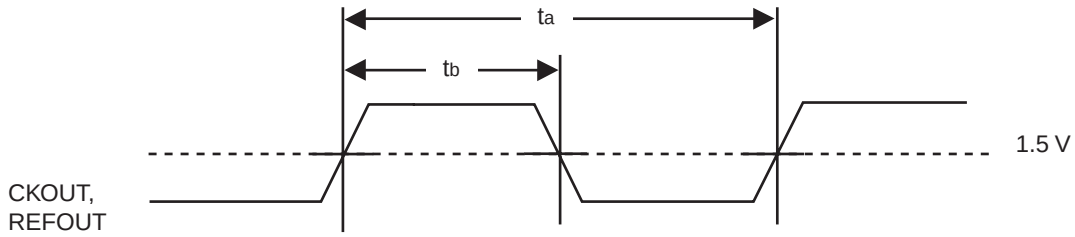
*1 : Duty of the REFOUT output is guaranteed only for the following A and B because it depends on t_{DCI} of input clock duty.

A. Resonator input : When resonator is connected with XIN and XOUT, and oscillates normally.

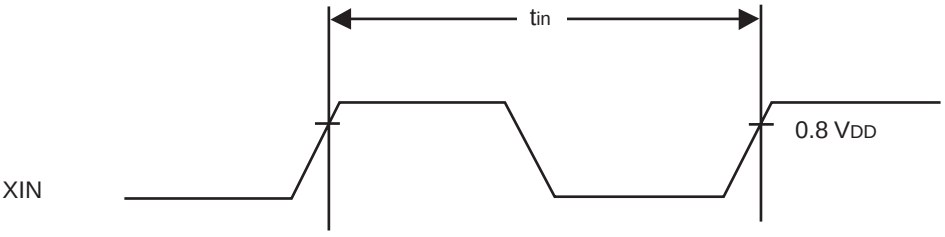
B. External clock input : The input level is Full-swing (V_{SS} – V_{DD}).

*2 : The modulation clock requires stabilization wait time after the IC is turned on or released from power-down mode, or after SEL (modulation factor) or ENS (modulation on/off) setting is changed. For the modulation clock stabilization wait time, assure the maximum value for the lock-up time.

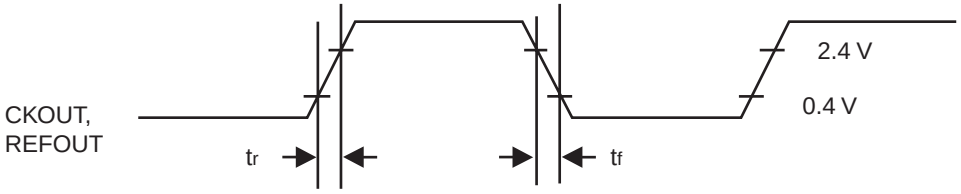
■ OUTPUT CLOCK DUTY CYCLE (t_{DCC}, $t_{DCR} = t_b/t_a$)



■ INPUT FREQUENCY ($f_{in} = 1/t_{in}$)

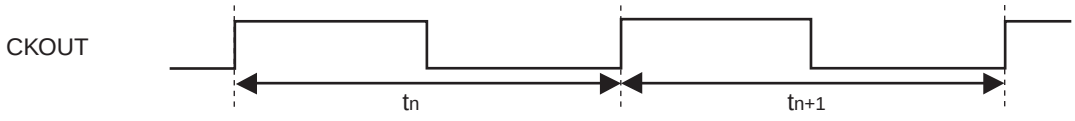


■ OUTPUT SLEW RATE (SR_C, SR_R)



Note : $SR_C = (2.4 - 0.4)/t_r$, $SR_C = (2.4 - 0.4)/t_f$
$SR_R = (2.4 - 0.4)/t_r$, $SR_R = (2.4 - 0.4)/t_f$

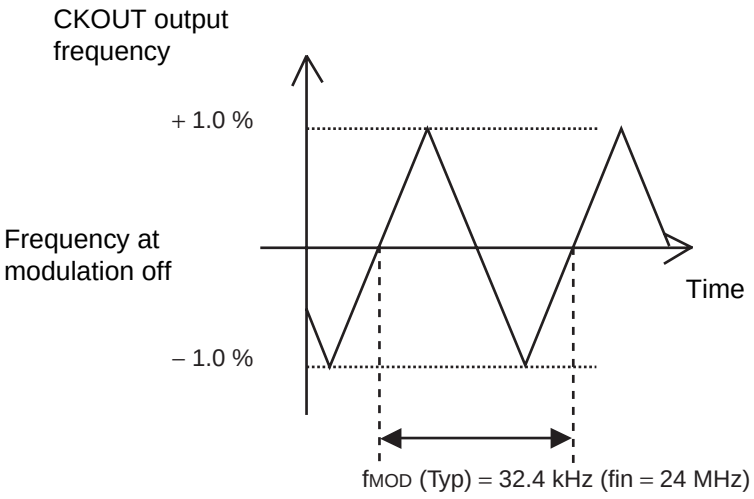
■ CYCLE-CYCLE JITTER ($t_{JC} = |t_n - t_{n+1}|$)



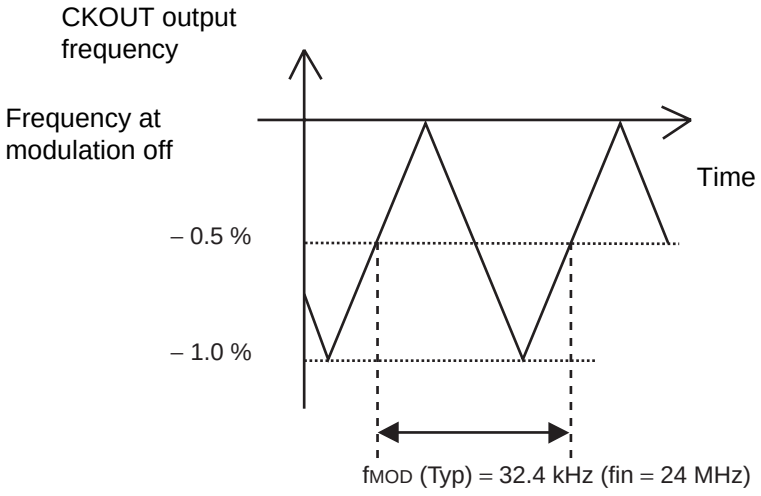
Note : Cycle-cycle jitter indicates the difference between a certain cycle and the immediately succeeding (or preceding) cycle.

■ MODULATION WAVEFORM

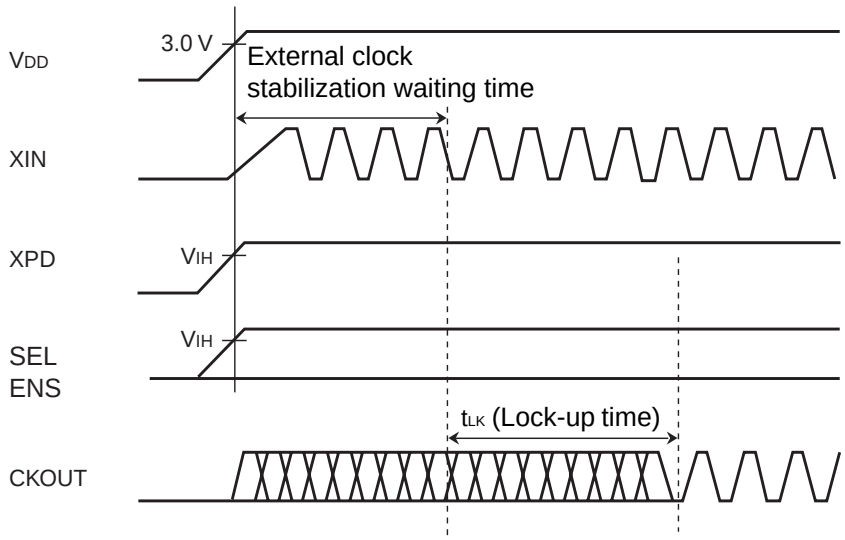
• Modulation rate ± 1.0%, example of center spread



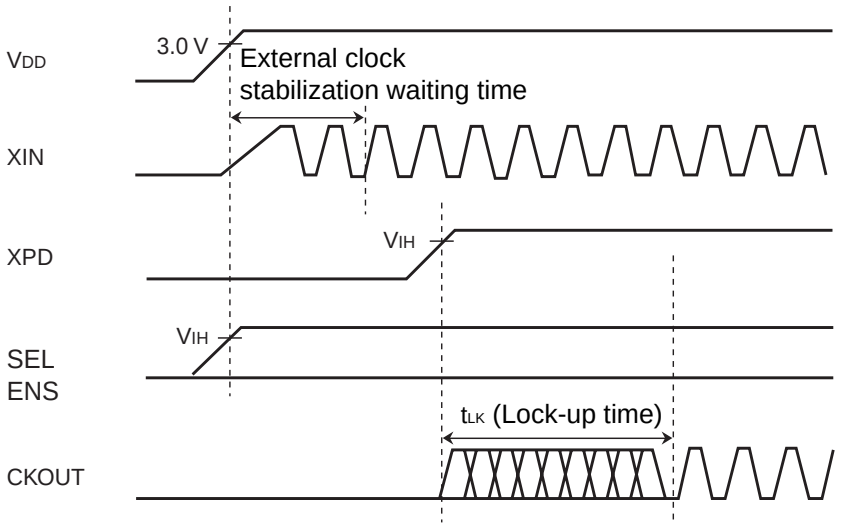
• Modulation rate – 1.0%, example of down spread



■ LOCK-UP TIME



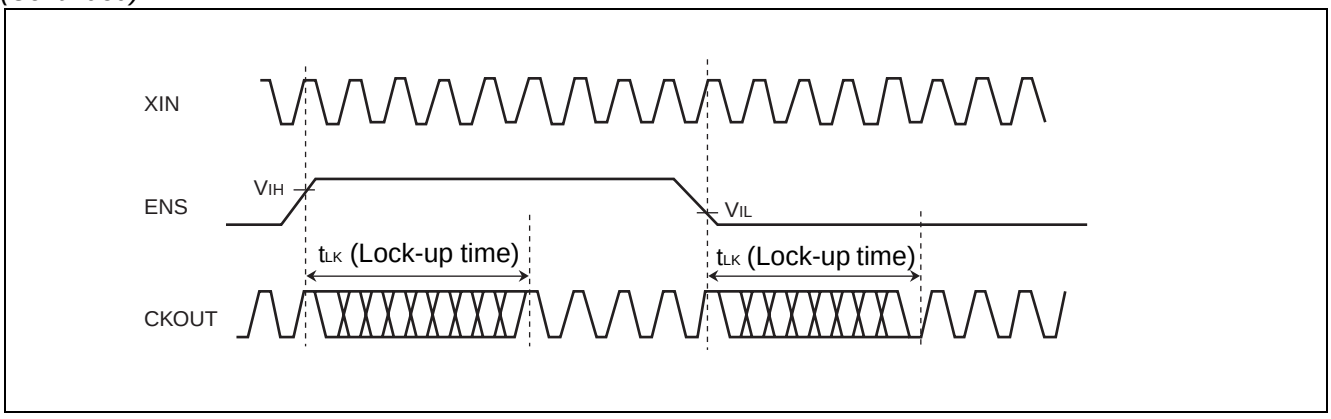
If the XPD pin is fixed at the “H” level, the maximum time after the power is turned on until the set clock signal is output from CKOUT pin is (the stabilization wait time of input clock to XIN pin) + (the lock-up time “t_{LK}”). For the input clock stabilization time, check the characteristics of the resonator or oscillator used.



If the XPD pin is used for power-down control, the set clock signal is output from the CKOUT pin at most the lock-up time “t_{LK}” after the XPD pin goes “H” level.

(Continued)

(Continued)



If the ENS pin is used for modulation enable control during normal operation, the set clock signal is output from the CKOUT pin at most the lock-up time "t_{LK}" after the level at the ENS pin is determined.

Note : The wait time for the clock signal output from the CKOUT pin to become stable is required after the IC is released from power-down mode by the XPD pin or after another pin's setting is changed. During the period until the output clock signal becomes stable, neither of the output frequency, output clock duty cycle, modulation period, and cycle-cycle jitter characteristic cannot be guaranteed. It is therefore advisable to take action, such as cancelling a device reset at the stage after the lock-up time has passed.

■ OSCILLATION CIRCUIT

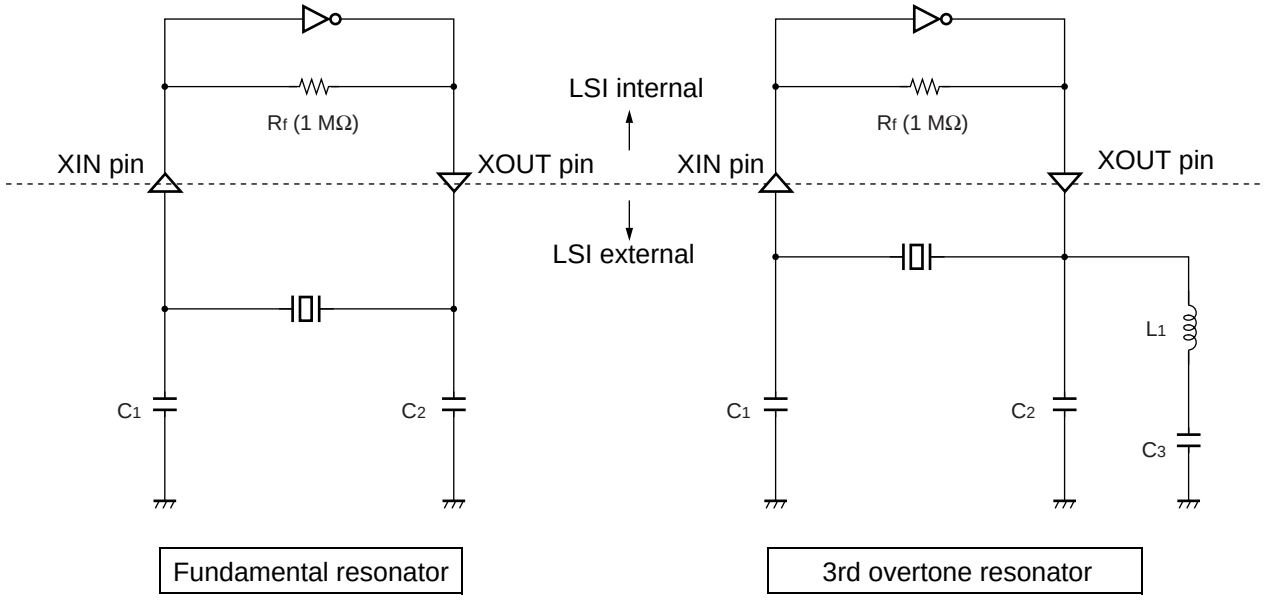
The following schematic on the left-hand side shows a sample connection of a general resonator. The oscillation circuit contains a feedback resistor (1 MΩ) . The values of capacitors (C_1 and C_2) must be adjusted to the optimum constant of the resonator used.

The following schematic on the right-hand side shows a sample connection of a 3rd overtone resonator. The values of capacitors (C_1, C_2, and C_3) and inductor (L_1) must be adjusted to the optimum constant of the resonator used.

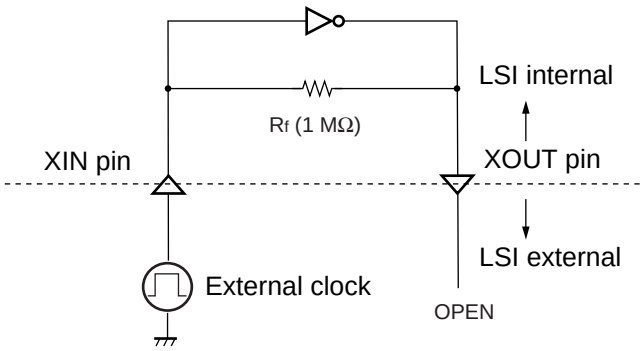
The most suitable value is different by individual resonator. Please refer to the resonator manufacturer which you use for the most suitable value.

To use an external clock signal (without using the resonator) , input the clock signal to the XIN pin with the XOUT pin connected to nothing .

• When using the resonator

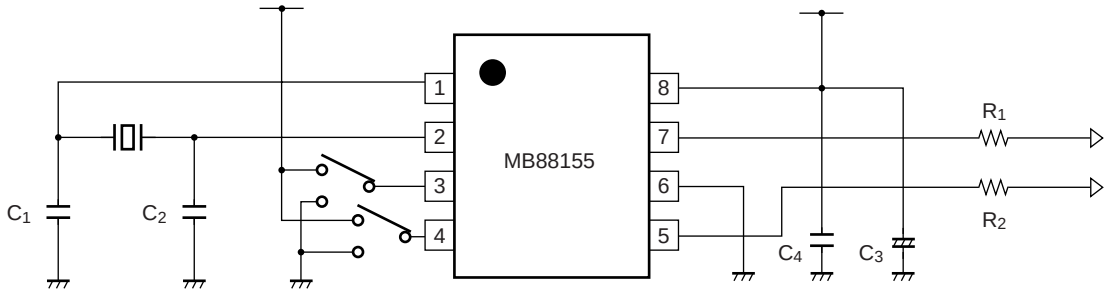


• When using the external clock



Note : Note that the jitter characteristic of the input clock signal may affect the cycle-cycle jitter characteristic.

■ INTERCONNECTION CIRCUIT EXAMPLE



C_1, C_2	: Oscillation stabilization capacitance (see ■ OSCILLATION CIRCUIT)
C_3	: Capacitor of 10 μF or higher
C_4	: Capacitor of about 0.01 μF (connect a capacitor of good high frequency property (ex. laminated ceramic capacitor) to close to this device)
R_1, R_2	: Impedance matching resistor for board pattern

■ SPECTRUM EXAMPLE CHARACTERISTICS

The condition of the examples of the characteristic is shown as follows : Input frequency = 16 MHz (Output frequency = 64 MHz : Using MB88155-410 (Multiplied by 4))
Power-supply voltage = 3.3 V, None load capacity. Modulation rate = ± 1.0% (center spread).
