MB91F527R/U/M/Y \*, MB91F528R/U/M/Y \*

*Data Sheet (Full Production)*

---

**Notice to Readers:** This document states the current technical specifications regarding the Spansion product(s) described herein. The Preliminary status of this document indicates that product qualification has been completed, and that initial production has begun. Due to the phases of the manufacturing process that require maintaining efficiency and quality, this document may be revised by subsequent versions or modifications due to changes in technical specifications.

## Notice On Data Sheet Designations

SpanSion Inc. issues data sheets with Advance Information or Preliminary designations to advise readers of product information or intended specifications throughout the product life cycle, including development, qualification, initial production, and full production. In all cases, however, readers are encouraged to verify that they have the latest information before finalizing their design. The following descriptions of SpanSion data sheet designations are presented here to highlight their presence and definitions.

### Advance Information

The Advance Information designation indicates that SpanSion Inc. is developing one or more specific products, but has not committed any design to production. Information presented in a document with this designation is likely to change, and in some cases, development on the product may discontinue. SpanSion Inc. therefore places the following conditions upon Advance Information content:

“This document contains information on one or more products under development at SpanSion Inc. The information is intended to help you evaluate this product. Do not design in this product without contacting the factory. SpanSion Inc. reserves the right to change or discontinue work on this proposed product without notice.”

### Preliminary

The Preliminary designation indicates that the product development has progressed such that a commitment to production has taken place. This designation covers several aspects of the product life cycle, including product qualification, initial production, and the subsequent phases in the manufacturing process that occur before full production is achieved. Changes to the technical specifications presented in a Preliminary document should be expected while keeping these aspects of production under consideration. SpanSion places the following conditions upon Preliminary content:

“This document states the current technical specifications regarding the SpanSion product(s) described herein. The Preliminary status of this document indicates that product qualification has been completed, and that initial production has begun. Due to the phases of the manufacturing process that require maintaining efficiency and quality, this document may be revised by subsequent versions or modifications due to changes in technical specifications.”

### Combination

Some data sheets contain a combination of products with different designations (Advance Information, Preliminary, or Full Production). This type of document distinguishes these products and their designations wherever necessary, typically on the first page, the ordering information page, and pages with the DC Characteristics table and the AC Erase and Program table (in the table notes). The disclaimer on the first page refers the reader to the notice on this page.

### Full Production (No Designation on Document)

When a product has been in production for a period of time such that no changes or only nominal changes are expected, the Preliminary designation is removed from the data sheet. Nominal changes may include those affecting the number of ordering part numbers available, such as the addition or deletion of a speed option, temperature range, package type, or VIO range. Changes may also include those needed to clarify a description or to correct a typographical error or incorrect specification. SpanSion Inc. applies the following conditions to documents in this category:

“This document states the current technical specifications regarding the SpanSion product(s) described herein. SpanSion Inc. deems the products to have been in sufficient production volume such that subsequent versions of this document are not expected to change. However, typographical or specification corrections, or modifications to the valid combinations offered may occur.”

Questions regarding these document designations may be directed to your local sales office.

# MB91520 Series

32-bit Microcontroller

FR Family FR81S

MB91F527R/U/M/Y \*, MB91F528R/U/M/Y \*

*Data Sheet (Full Production)*

## ■ DESCRIPTION

The MB91520 series is a Spansion 32-bit microcontroller designed for automotive devices. This series contains the FR81S CPU which is compatible with the FR family.

Note: FR is a line of products of Spansion Inc.

\*:This series is a composition of the kind that adds HC/JC/KC/LC/SC/UC/WC/YC to the end of the above-mentioned each name of articles of presence, According to Presence of sub-clock, CSV initial value and LVD initial value.

Please see "■ORDERING INFORMATION" for details.

Spansion provides information facilitating product development via the following website.  
The website contains information useful for customers.

## ■ FEATURES

### ● FR81S CPU Core

- 32-bit RISC, load/store architecture, 5-stage pipeline
- Maximum operating frequency:
  - MB91F52xR/MB91F52xU(LQFP): 80 MHz (Source oscillation = 4.0 MHz and 20 multiplied (PLL clock multiplication system))
  - MB91F52xR/MB91F52xU(TEQFP): 128 MHz (Source oscillation = 4.0 MHz and 32 multiplied (PLL clock multiplication system))
  - MB91F52xM/ MB91F52xY: 128 MHz (Source oscillation = 4.0 MHz and 32 multiplied (PLL clock multiplication system))
- General-purpose register : 32-bit × 16 sets
- 16-bit fixed length instructions (basic instruction), 1 instruction per cycle
- Instructions appropriate to embedded applications
  - Memory-to-memory transfer instruction
  - Bit processing instruction
  - Barrel shift instruction etc.
- High-level language support instructions
  - Function entry/exit instructions
  - Register content multi-load and store instructions
- Bit search instructions
  - Logical 1 detection, 0 detection, and change-point detection
- Branch instructions with delay slot
  - Decrease overhead during branch process
- Register interlock function
  - Easy assembler writing
- Built-in multiplier and instruction level support
  - Signed 32-bit multiplication : 5 cycles
  - Signed 16-bit multiplication : 3 cycles
- Interrupt (PC/PS saving)
  - 6 cycles (16 priority levels)
- The Harvard architecture allows simultaneous execution of program and data access.
- Instruction compatibility with the FR family
- Built-in memory protection function (MPU)
  - Eight protection areas can be specified commonly for instructions and the data.
  - Control access privilege in both privilege mode and user mode.
- Built-in FPU (floating point arithmetic)
  - IEEE754 compliant
  - Floating-point register 32-bit × 16 sets

### ● Peripheral functions

- Clock generation (equipped with SSCG function)
  - Main oscillation (4MHz to 16MHz)
  - Sub oscillation (32kHz) or no sub oscillation
- PLL multiplication rate : 1 to 20 times for MB91F52xR/MB91F52xU(LQFP)
  - : 1 to 32 times for MB91F52xR/MB91F52xU(TEQFP)
  - : 1 to 32 times for MB91F52xM/MB91F52xY
- 100 kHz CR oscillator mounted
- Maximum operating frequency:
  - Peripheral bus clock: 40MHz
  - External bus clock: 40MHz
- Built-in Program flash capacity
  - MB91F527 : 1536KB + 64KB
  - MB91F528 : 2048KB + 64KB
- Built-in Data flash (WorkFlash) 64KB

- Built-in RAM capacity
  - Main RAM
    - MB91F527 : 192KB
    - MB91F528 : 192KB + 128KB (128KB located in the AHB area, a penalty given at access)
  - Backup RAM 16KB
- General-purpose ports :
  - MB91F527R/MB91F528R : 115 (none sub oscillation), 113 (with sub oscillation)
  - MB91F527U/MB91F528U : 147 (none sub oscillation), 145 (with sub oscillation)
  - MB91F527M/MB91F528M : 177 (none sub oscillation), 175 (with sub oscillation)
  - MB91F527Y/MB91F528Y 219 (none sub oscillation), 217 (with sub oscillation)
  - Included I<sup>2</sup>C pseudo open drain ports : Max. 30
- External bus interface
  - 22-bit address, 8/16-bit data
- DMA Controller
  - Up to 16 channels can be started simultaneously.
  - 2 transfer factors (Internal peripheral request and software)
- A/D converter (successive approximation type)
  - 12-bit resolution : Max. 64 channels (32 channels +32 channels)
  - Conversion time : 1μs
- D/A converter (R-2R type)
  - 8-bit resolution : 2 channels
- External interrupt input: Max. 24 channels
  - Level ("H" / "L"), or edge detection (rising or falling) supported
- Multi-function serial communication (built-in transmission/reception FIFO memory) : Max. 20 channels  
 5V tolerant input 8 channels (ch.6, ch.8, ch.9, ch.11, ch.16 to ch.19) CMOS hysteresis input  
 < UART (Asynchronous serial interface) >
  - Full-duplex double buffering system, 64-byte transmission FIFO memory, 64-byte reception FIFO memory
  - Parity or no parity is selectable.
  - Built-in dedicated baud rate generator
  - The external clock can be used as the transfer clock
  - Parity, frame, and overrun error detect functions provided
  - DMA transfer support
 < CSIO (Synchronous serial interface) >
  - Full-duplex double buffering system, 64-byte transmission FIFO, memory, 64-byte reception FIFO memory
  - SPI supported; master and slave systems supported; 5-bit to 16-bit, 20-bit, 24-bit, 32-bit data length can be set.
  - Built-in dedicated baud rate generator (Master operation)
  - The external clock can be entered. (Slave operation)
  - Overrun error detection function is provided
  - DMA transfer support
  - Serial chip select SPI function
 < LIN (Asynchronous Serial Interface for LIN) >
  - Full-duplex double buffering system, 64-byte transmission FIFO memory, 64-byte reception FIFO memory
  - LIN protocol revision 2.1 supported
  - Master and slave systems supported
  - Framing error and overrun error detection
  - LIN synch break generation and detection; LIN synch delimiter generation
  - Built-in dedicated baud rate generator
  - The external clock can be adjusted by the reload counter
  - DMA transfer support
  - Hardware assist function

# < I<sup>2</sup>C >

- 10 channels (ch.3, ch.4, ch.12 to ch.19) Standard mode / High-speed mode supported
- 5 channels (ch.5 to ch.8, ch.11) Standard mode supported
- Full-duplex double buffering system, 64-byte transmission FIFO memory, 64-byte reception FIFO memory
- Standard mode (Max. 100kbps) / High-speed mode (Max. 400kbps) supported
- DMA transfer supported (for transmission only)
- CAN : 6 channels
  - Transfer speed : Up to 1Mbps
  - 128-transmission/reception message buffering : 6 channels
- FlexRay controller: 1 unit (ch.A/ch.B)
  - FlexRay specification version 2.1 supported
  - Max. 128-message buffer configuration
  - 8KB message RAM
  - Variable-length message buffer configuration
  - Each message buffer can be configured as a part of a reception buffer, transmission buffer, or reception FIFO.
  - Host access to message buffers through input and output buffers
  - Filtering the slot counter, cycle counter, and channels
  - Maskable interrupts
- PPG : 16-bit × Max. 88 channels
  - LED drive output 4 channels (ch.11 to ch.14)
- Reload timer : 16-bit × 8 channels
- Free-run timer :
  - 16-bit × 3 channels
  - 32-bit × Max. 8 channels
- Input capture :
  - 16-bit × 4 channels (linked to the free-run timer)
  - 32-bit × Max. 8 channels (linked to the free-run timer)
- Output compare :
  - 16-bit × 6 channels (linked to the free-run timer)
  - 32-bit × Max. 8 channels (linked to the free-run timer)
- Wave generator : 6 channels
- U/D counter:
  - 8/16-bit up/down counter × Max. 4 channels
- Real-time clock (RTC) (for day, hours, minutes, seconds)
  - Main oscillation / sub oscillation frequency can be selected for the operation clock.
- Calibration: A real-time clock (RTC) of the sub clock drive.
  - The main clock to sub clock ratio can be corrected by setting the real-time clock prescaler
- Clock Supervisor
  - Monitoring abnormality (damage of crystal etc.) of sub oscillation (32kHz) (dual clock products) and main oscillation (4 MHz).
  - When abnormality is detected, it switches to the CR clock.
  - For some devices, ON/OFF can be selected as the initial value.
- Base timer : 2 channels
  - 16-bit timer
  - The timer mode is selected from PWM/PPG/PWC/reload.
  - In the cascaded mode, a pair of 16-bit timers can be used as one 32-bit timer.
- CRC generation
- Watchdog timer
  - Hardware watchdog
  - Software watchdog (An effective range of a clear counter can be set.)
- NMI
- Interrupt controller
- Interrupt request batch read
  - Multiple interrupts from peripherals can be read by a series of registers.
- I/O relocation
  - Peripheral function pins can be reassigned.

- Low-power consumption mode
  - Sleep / Stop / Watch / Sub RUN mode
  - Stop (power shutdown) / Watch (power shutdown) mode
- Power on reset
- Low-voltage detection reset (External power supply and Internal power supply are independently observed.)
  - For some devices, ON/OFF can be selected as the initial value for external power supply.
- Tuning RAM
  - Capacity: 128 KB
  - Can be used as RAM for data tuning.
- JTAG pins (TRST, TCK, TMS, TDI, TDO)
- Device Package : LQFP-144/176/208, TEQFP-144(planning)/176/208, BGA-416
- CMOS 90nm Technology
- Power supplies
  - 5V or 3V Power supply
  - The internal 1.2V is generated from 5V with the voltage step-down regulator.
  - Restriction on the power-on sequence (from VCC to VCCE)
  - Applying a voltage higher than the power supply voltage to an analog signal input is prohibited.
- Operation guaranteed voltage range (recommended): 3.0V to 5.5V (within the range guaranteed by AC and DC spec)
- Operation guaranteed voltage range: 2.7V to 5.5V

## ■ PRODUCT LINEUP

| Package                               | LQFP-144 / TEQFP-144 (planning) *3                                                                                                                               |           |

\*1: The limitation with the package has been described by the item of the power consumption of "Absolute maximum ratings".

\*2: PPG output pins on ch.38 and ch.39 do not exist. See "Pins of PPG (ch.0 to ch.87)."

\*3: TEQFP-144pin is planning. Please contact sales representatives about details.

## ■ HANDLING PRECAUTIONS

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Spansion semiconductor devices.

### 1. Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

- Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

- Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

- Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

- (1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

- (2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

- (3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

- Latch-up

Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNP junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

**CAUTION:** The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

- (1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.

- (2) Be sure that abnormal current flows do not occur during the power-on sequence.

- **Observance of Safety Regulations and Standards**

Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

- **Fail-Safe Design**

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

- **Precautions Related to Usage of Devices**

SpanSion semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

**CAUTION:** Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

## 2. Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under SpanSion's recommended conditions. For detailed information about mount conditions, contact your sales representative.

- **Lead Insertion Type**

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to SpanSion recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

- **Surface Mount Type**

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. SpanSion recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with SpanSion ranking of recommended conditions.

- **Lead-Free Packaging**

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

- **Storage of Semiconductor Devices**

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.  
When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, Spansion packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

- **Baking**

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Spansion recommended conditions for baking.

Condition: 125°C/24 h

- **Static Electricity**

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).  
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

### 3. Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

#### (1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

#### (2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

#### (3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

#### (4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

#### (5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of SpanSion products in other special environmental conditions should consult with sales representatives.

## ■ HANDLING DEVICES

This section explains the latch-up prevention and pin processing.

### • For latch-up prevention

If a voltage higher than  $V_{CC}$  ( $V_{CCE}$  in case of terminal corresponding to  $V_{CCE}$  power supply.) or a voltage lower than  $V_{SS}$  is applied to an I/O pin, or if a voltage exceeding the ratings is applied between  $V_{CC}$  and  $V_{SS}$  pins or  $V_{CCE}$  and  $V_{SS}$  pins, a latch-up may occur in CMOS IC. If the latch-up occurs, the power supply current increases excessively and device elements may be damaged by heat. Take care to prevent any voltage from exceeding the maximum ratings in device application.

Also, the analog power supply ( $AV_{CC}$ ,  $AVRH$ ), analog input and digital power supply ( $V_{CCE}$ ) must not be exceed the digital power supply ( $V_{CC}$ ) when the power supply to the analog system and digital power supply ( $V_{CCE}$ ) are turned on or off.

In the correct power-on sequence of the microcontroller, turn on the digital power supply ( $V_{CC}$ ), analog power supplies ( $AV_{CC}$ ,  $AVRH$ ) and digital power supply ( $V_{CCE}$ ) simultaneously. Or, turn on the digital power supply ( $V_{CC}$ ), and then turn on analog power supplies ( $AV_{CC}$ ,  $AVRH$ ) and digital power supply ( $V_{CCE}$ ).

### • Treatment of unused pins

If unused input pins are left open, they may cause a permanent damage to the device due to malfunction or latch-up. Connect at least a 2k $\Omega$  resistor to each of the unused pins for pull-up or pull-down processing.

Also, if I/O pins are not used, they must be set to the output state for releasing or they must be set to the input state and treated in the same way as for the input pins.

### • Power supply pins

The device is designed to ensure that if the device contains multiple  $V_{CC}$  or  $V_{SS}$  pins, the pins that should be at the same potential are interconnected to prevent latch-up or other malfunctions. Further, connect these pins to an external power supply or ground to reduce unwanted radiation, prevent strobe signals from malfunctioning due to a raised ground level, and fulfill the total output current standard, etc. As shown in figure 1, all  $V_{SS}$  power supply pins must be treated in the similar way. If multiple  $V_{CC}$  or  $V_{SS}$  systems are connected, the device cannot operate correctly even within the guaranteed operating range.

Figure 1 Power Supply Input Pins

The power supply pins should be connected to  $V_{CC}$  and  $V_{SS}$  pins of this device at the low impedance from the power supply source.

In the area close to this device, a ceramic capacitor having the capacitance larger than the capacitor of C pin is recommended to use as a bypass capacitor between  $V_{CC}$  and  $V_{SS}$  pins.

- **Crystal oscillation circuit**

An external noise to the X0 or X1 pin may cause a device malfunction. The printed circuit board must be designed to lay out X0 and X1 pins, crystal oscillator (or ceramic resonator), and the bypass capacitor to be grounded to the close position to the device.

The printed circuit board artwork is recommended to surround the X0 and X1 pins by ground circuits.

- **Mode pins (MD1, MD0)**

Connect the MD1 and MD0 mode pins to the  $V_{CC}$  or  $V_{SS}$  pin directly. To prevent an erroneous selection of test mode caused by the noise, reduce the pattern length between each mode pin and  $V_{CC}$  or  $V_{SS}$  pin on the printed circuit board. Also, use the low-impedance pin connection.

- **During power-on**

To prevent a malfunction of the voltage step-down circuit built in the device, set the voltage rising time to have 50 $\mu$ s or longer (between 0.2V and 2.7V) during power-on.

- **Notes during PLL clock operation**

When the PLL clock is selected and if the oscillator is disconnected or if the input is stopped, this clock may continue to operate at the free running frequency of the self-oscillator circuit built in the PLL clock. This operation is not guaranteed.

- **Treatment of A/D converter power supply pins**

Connect the pins to have  $AV_{CC}=AVRH=V_{CC}$  and  $AV_{SS}/AVRL=V_{SS}$  even if the A/D converter is not used.

- **Notes on using external clock**

An external clock is not supported. None of the external direct clock input can be used for both main clock and sub clock.

- **Power-on sequence of A/D converter analog inputs**

Be sure to turn on the digital power supply ( $V_{CC}$ ,  $V_{CCE}$ ) first, and then turn on the A/D converter power supplies ( $AV_{CC}$ ,  $AVRH$ ,  $AVRL$ ) and analog inputs ( $AN0$  to  $AN63$ ). Also, turn off the A/D converter power supplies and analog inputs first, and then turn off the digital power supply ( $V_{CC}$ ,  $V_{CCE}$ ). When the  $AVRH$  pin voltage is turned on or off, it must not exceed  $AV_{CC}$ . Even if a common analog input pin is used as an input port, its input voltage must not exceed  $AV_{CC}$ . (However, the analog power supply and digital power supply can be turned on or off simultaneously.)

- **Treatment of C pin**

This device contains a voltage step-down circuit. A capacitor must always be connected to the C pin to assure the internal stabilization of the device. For the standard values, see the "Recommended Operating Conditions" of the latest data sheet.

Note: Please see the latest data sheet for a detailed specification of the operation voltage.

- **Function switching of a multiplexed port**

To switch between the port function and the multiplexed pin function, use the PFR (port function register). However, if a pin is also used for an external bus, its function is switched by the external bus setting. For details, see "I/O PORTS" in the hardware manual.

- **Low-power consumption mode**

To transit to the sleep mode, watch mode, stop mode, watch mode(power-off) or stop mode(power-off), follow the procedure explained in "Activating the sleep mode, watch mode, or stop mode" or "Activating the watch mode (power-off) or stop mode(power-off)" of " POWER CONSUMPTION CONTROL" in the hardware manual.

Take the following notes when using a monitor debugger.

- Do not set a break point for the low-power consumption transition program.
- Do not execute an operation step for the low-power consumption transition program.

- **Notes When Writing Data in a Register Having the Status Flag**

When writing data in the register that has a status flag (especially, an interrupt request flag) to control function, taking care not to clear its status flag erroneously must be followed.

The program must be written not to clear the flag to the status bit, and then to set the control bits to have the desired value.

Especially, if multiple control bits are used, the bit instruction cannot be used. (The bit instruction can access to a single bit only.) By the Byte, Half-word, or Word access, data is written to the control bits and status flag simultaneously. During this time, take care not to clear other bits (in this case, the bits of status flag) erroneously.

Note: These points can be ignored because the bit instructions are already taken the points into consideration.

[S]:It is a system register. The illegal instruction exception (data access error) is generated in these registers in the user mode when reading and writing to it.

## ■ INTERRUPT VECTOR TABLE

This list shows the assignments of interrupt factors and interrupt vectors/interrupt control registers.

### ● Interrupt vector

• MB91F52xR (144pin)

| Interrupt factor                                              | Interrupt number |              | Interrupt level              | Offset           | Default address for TBR            | RN *            |
|---------------------------------------------------------------|------------------|--------------|------------------------------|------------------|------------------------------------|-----------------|
|                                                               | Decimal          | Hexa-decimal |                              |                  |                                    |                 |

- \*: It does not support the DMA transfer request by the interrupt generated from a peripheral to which no RN (Resource Number) is assigned.  
 \*1: The status of the multi-function serial interface does not support the DMA transfer by the I<sup>2</sup>C reception and FlexRay.  
 \*2: The reload timer ch.4 to ch.7 does not support the DMA transfer by the interrupt.  
 \*3: The PPG ch.24 to ch.87 does not support the DMA transfer by the interrupt.  
 \*4: The clock calibration unit does not support the DMA transfer by the interrupt.  
 \*5: It does not support the DMA transfer by the interrupt because of the RAM ECC bit error.  
 \*6: The 32-bit free-run timer ch.3 to ch.10 does not support the DMA transfer by the interrupt.  
 \*8: It does not support the DMA transfer by the external low-voltage detection interrupt.  
 \*9: It does not support the DMA transfer by the FlexRay interrupt.  
 \*10: It does not support the DMA transfer by the FlexRay timer interrupt.  
 \*11: REALOS is a trademark of Spansion LLC.

\*: It does not support the DMA transfer request by the interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: The status of the multi-function serial interface does not support the DMA transfer by the I<sup>2</sup>C reception and FlexRay.

\*2: The reload timer ch.4 to ch.7 does not support the DMA transfer by the interrupt.

\*3: The PPG ch.24 to ch.87 does not support the DMA transfer by the interrupt.

\*4: The clock calibration unit does not support the DMA transfer by the interrupt.

\*5: It does not support the DMA transfer by the interrupt because of the RAM ECC bit error.

\*6: The 32-bit free-run timer ch.3 to ch.10 does not support the DMA transfer by the interrupt.

\*8: It does not support the DMA transfer by the external low-voltage detection interrupt.

\*9: It does not support the DMA transfer by the FlexRay interrupt.

\*10: It does not support the DMA transfer by the FlexRay timer interrupt.

\*: It does not support the DMA transfer request by the interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: The status of the multi-function serial interface does not support the DMA transfer by the I<sup>2</sup>C reception and FlexRay.

\*2: The reload timer ch.4 to ch.7 does not support the DMA transfer by the interrupt.

\*3: The PPG ch.24 to ch.87 does not support the DMA transfer by the interrupt.

\*4: The clock calibration unit does not support the DMA transfer by the interrupt.

\*5: It does not support the DMA transfer by the interrupt because of the RAM ECC bit error.

\*6: The 32-bit free-run timer ch.3 to ch.10 does not support the DMA transfer by the interrupt.

\*8: It does not support the DMA transfer by the external low-voltage detection interrupt.

\*9: It does not support the DMA transfer by the FlexRay interrupt.

\*10: It does not support the DMA transfer by the FlexRay timer interrupt.

\*: It does not support the DMA transfer request by the interrupt generated from a peripheral to which no RN (Resource Number) is assigned.

\*1: The status of the multi-function serial interface does not support the DMA transfer by the I<sup>2</sup>C reception and FlexRay.

\*2: The reload timer ch.4 to ch.7 does not support the DMA transfer by the interrupt.

\*3: The PPG ch.24 to ch.87 does not support the DMA transfer by the interrupt.

\*4: The clock calibration unit does not support the DMA transfer by the interrupt.

\*5: It does not support the DMA transfer by the interrupt because of the RAM ECC bit error.

\*6: The 32-bit free-run timer ch.3 to ch.10 does not support the DMA transfer by the interrupt.

\*8: It does not support the DMA transfer by the external low-voltage detection interrupt.

\*9: It does not support the DMA transfer by the FlexRay interrupt.

\*10: It does not support the DMA transfer by the FlexRay timer interrupt.

| Operating temperature               |                                  | T <sub>A</sub>       | -40                  | +105                  | °C      |                                           |
|                                     |                                  |                      | -40                  | +125                  | °C      | *7                                        |
| Storage temperature                 |                                  | Tstg                 | -55                  | +150                  | °C      |                                           |

\*1: These parameters are based on the condition that  $V_{SS}=AV_{SS}=0.0\text{V}$

\*2: Caution must be taken that  $AV_{CC}$ ,  $AVRH$  and  $V_{CCE}$  do not exceed  $V_{CC}$  upon power-on and under other circumstances.

\*3: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.

\*4: The average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current  $\times$  the operation ratio.

\*5: The total output current is defined as the maximum current value flowing through all of corresponding pins.

- \*6:
  - Corresponding pins: all general-purpose ports except P035, 041, 093, 122, P222, P227, P232 and P236.
  - Use within recommended operating conditions.
  - Use at DC voltage (current).
  - The + B signal should always be applied by connecting a limiting resistor between the + B signal and the microcontroller.
  - The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the + B signal is input.
  - Note that when the microcontroller drive current is low, such as in the low power consumption modes, the + B input potential can increase the potential at the  $V_{CC}$  pin via a protective diode, possibly affecting other devices.
  - Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.
  - Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
  - Do not leave + B input pins open.
- \*7: When it is used under this condition, contact your sales representative.
- \*8: It is a standard when four-layer substrate is used.
- \*9: Please see to the item of "Product lineup" for details.
- \*10: It is a condition that can be used by limiting the product type of TEQFP and BGA.
- \*11: It is a condition that can be used by the package limitation of FPT-144P-M08 and FPT-176P-M07.
- \*12: It is a condition that can be used by limiting the package of FPT-208P-M06.

#### Sample recommended circuit

#### <WARNING>

Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

## 2. Recommended operating conditions

(V<sub>SS</sub>=AV<sub>SS</sub>=0.0V)

|                                   |                  | -40                            | +125 | °C   | *3                                                                                                                                                                                               |

\*1: When it is used outside recommended operation guarantee range (range of the operation guarantee), contact your sales representative. Moreover, minimum value with an effective external low-voltage detection reset becomes a voltage until generating low-voltage detection reset.

\*2: See the following diagram for details on the connection of smoothing capacitor C<sub>S</sub>.

\*3: When it is used under this condition, contact your sales representative.

## • C Pin Connection Diagram

## &lt;WARNING&gt;

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.

Any use of semiconductor devices will be under their recommended operating condition. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

## 3. DC characteristics

 $(T_A: -40^{\circ}\text{C to } +105^{\circ}\text{C}, V_{CC} = AV_{CC} = 5.0\text{V} \pm 10\% / V_{CC} = AV_{CC} = 3.3\text{V} \pm 0.3\text{V}, V_{SS} = AV_{SS} = 0.0\text{V})$

\*1: It is a standard in BRAMSC (Backup RAM sleep control bit)=1(Enter the state of the sleep at the standby mode) condition.

\*2: It is a prohibition two flash or more writing/erasing the flash and the WorkFlash for the internally stored program at the same time.

\*3: There is a frequency limitation by the product type. Please see "4. AC Characteristics" for details.

\*1: The maximum / minimum value is defined when using the main clock and PLL clock.

\*2: Please use it with external load capacity 12pF or less for V<sub>CC</sub>=3.3V±0.3V (40MHz operation).

\*3: MB91F52xR/MB91F52xU(LQFP) is 80MHz or less.

MB91F52xR/MB91F52xU(TEQFP) and MB91F52xM/MB91F52xY is 128MHz or less.

\*4: MB91F52xR/MB91F52xU(LQFP) is 12.5ns or more.

MB91F52xR/MB91F52xU(TEQFP) and MB91F52xM/MB91F52xY is 7.82ns or more.

## • X0,X1 clock timing

• CAN PLL jitter

Deviation time from the ideal clock is assured per cycle out of 20,000 cycles.

## (1-2) Sub clock timing

(T<sub>A</sub>: -40°C to +125°C, V<sub>CC</sub>=AV<sub>CC</sub>=5.0V ± 10%/V<sub>CC</sub>=AV<sub>CC</sub>=3.3V±0.3V, V<sub>SS</sub>=AV<sub>SS</sub>=0.0V)

| Parameter                           | Symbol            | Pin name | Conditions | Value |        |     | Unit | Remarks |

• Example of oscillation circuit

Note: As to the product with its clock supervisor's initial value is "ON", when the oscillator is unable to start within 20ms from the stop state the clock supervisor will detect the oscillation stop. As a result, the CPU moves to the fail safe operation.

Design your print circuit board so that the oscillator can start oscillation within 20ms. Moreover, it is recommended to be designed after the match evaluation of the circuit is requested to the departure pendulum maker when the oscillation circuit is composed.

AC characteristics are specified by the following measurement reference voltage values.

## (2) Reset Input

(T<sub>A</sub>: -40°C to +125°C, V<sub>CC</sub>= AV<sub>CC</sub>=5.0V ± 10%/V<sub>CC</sub>=AV<sub>CC</sub>=3.3V±0.3V, V<sub>SS</sub>=AV<sub>SS</sub>=0.0V)

| Parameter                     | Sym<br>bol        | Pin<br>name | Con<br>ditio<br>ns | Value                                   |     | Unit | Remarks               |
|-------------------------------|-------------------|-------------|--------------------|-----------------------------------------|-----|------|-----------------------|
|                               |                   |             |                    | Min                                     | Max |      |                       |
| Reset input time              | t <sub>RSTL</sub> | RSTX        | —                  | 10                                      | —   | μs   | When normal operation |
|                               |                   |             |                    | Oscillation time of oscillator*<br>+100 | —   | μs   | At Stop mode          |
|                               |                   |             |                    | 100                                     | —   | μs   | At Watch mode         |
| Width for reset input removal |                   |             |                    | 1                                       | —   | μs   |                       |

\*: The oscillation time of the oscillator is the time it takes for the amplitude of the oscillations to reach 90%. For crystal oscillators, this time is between several ms and several tens of ms, for ceramic oscillators the time is between several hundred μs and several ms, and for an external clock, the time is 0 ms.

## (3) Power-on Conditions

(T<sub>A</sub>: -40°C to +125°C, V<sub>SS</sub>=0.0V)

| Parameter                           | Symbol           | Pin name        | Conditions                                              | Value |     |       | Unit  | Remarks |
|-------------------------------------|------------------|-----------------|---------------------------------------------------------|-------|-----|-------|-------|---------|

| Level detection voltage             | —                | V <sub>CC</sub> | —                                                       | 2.024 | 2.2 | 2.376 | V     |         |
| Level detection hysteresis width    | —                | V <sub>CC</sub> | —                                                       | —     | 100 | —     | mV    |         |
| Level detection time                | —                | —               | —                                                       | —     | —   | 30    | μs    | *1      |
| Slope detection undetected standard | —                | V <sub>CC</sub> | V <sub>CC</sub> = at level detection release level time | —     | —   | 4     | mV/μs | *2      |
| Power off time                      | t <sub>OFF</sub> | V <sub>CC</sub> | —                                                       | 50    | —   | —     | ms    | *3      |

\*1: If the fluctuation of the power supply is faster than the low voltage detection time, there is the possibility to generate or release after the power supply voltage has exceeded the detection voltage range.

\*2: When setting the power supply fluctuation to this standard or less, it is possible to suppress the slope detection. This is the standard when the power supply fluctuation is stable.

\*3: This time is to start the slope detection at next power on after power down and internal charge loss.

## Notes:

- AC characteristic in CLK synchronized mode.
- $C_L$  is the load capacitance applied to pins during testing.
- The maximum baud rate is limited by internal operation clock used and other parameters. Please use ch.3 and ch.4 with maximum baud rate 400kbps or less.  
See Hardware Manual for details.

• Internal shift clock mode

• External shift clock mode

\*: It writes in the TDR register and, then, it changes.

\*1:  $t_{CSSU} = \text{SCSTR:CSSU7-0} \times \text{Serial chip select timing operating clock}$

\*2:  $t_{CSHD} = \text{SCSTR:CSHD7-0} \times \text{Serial chip select timing operating clock}$

\*3:  $t_{CSDS} = \text{SCSTR:CSDS15-0} \times \text{Serial chip select timing operating clock}$

Regardless of the deselect time setting, once after the serial chip select pin becomes inactive, it will take at least five peripheral bus clock cycles to be active again.

Please see the hardware manual for details of above-mentioned \*1, \*2, and \*3.

(4-1-8) Bit setting: SMR:MD2=0, SMR:MD1=1, SMR:MD0=0,

When Serial chip select is used: SCSCR:CSEN=1,

Serial clock output mark level "L" : SMR,SCSFR:SCINV=1,

Serial chip select Inactive level "L" : SCSCR,SCSFR:CSLVL=0

\*1:  $t_{CSSU}=SCSTR:CSSU7-0 \times$  Serial chip select timing operating clock

\*2:  $t_{CSHD}=SCSTR:CSHD7-0 \times$  Serial chip select timing operating clock

\*3:  $t_{CSDS}=SCSTR:CSDS15-0 \times$  Serial chip select timing operating clock

Regardless of the deselect time setting, once after the serial chip select pin becomes inactive, it will take at least five peripheral bus clock cycles to be active again.

Please see the hardware manual for details of above-mentioned \*1,\*2, and \*3.

Notes: Only ch.3, ch.4 and ch.12-ch.19 are standard mode/high-speed mode correspondence. In ch.5-ch.8 and ch.11, only a standard mode is correspondences.

\*1: R and C<sub>L</sub> represent the pull-up resistance and load capacitance of the SCL and SDA output lines, respectively.

V<sub>P</sub> shows that the power-supply voltage of the pull-up resistor and I<sub>OL</sub> shows the V<sub>OL</sub> guarantee current.

\*2: The maximum t<sub>HDDAT</sub> only has to be met if the device does not extend the "L" width (t<sub>LOW</sub>) of the SCL signal.

\*3: A high-speed mode I<sup>2</sup>C bus device can be used on a standard mode I<sup>2</sup>C bus system as long as the device satisfies the requirement of "t<sub>SUDAT</sub> ≥ 250 ns".

\*4: t<sub>CPP</sub> is the peripheral clock cycle time. Adjust the clock of the bus in the surrounding to 8MHz or more when use I<sup>2</sup>C.

| Variation between channels    | -                | AN0 to AN63 | -            | -    | 4            | LSB  |                                                          |

\*1: Time for each channel.

\*2: Power supply current (V<sub>CC</sub> = AV<sub>CC</sub> = 5.0 V) is specified if A/D converter is not operating and CPU is stopped.

\*3: The power supply current described only current value on A/D converter.

The total AV<sub>CC</sub> current value must be calculated the power supply current for A/D converter and D/A converter.

(Note) Please use the clock of 0.5MHz-20MHz for the output clock of A/D converter to guarantee accuracy.

## (2) Definition of A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Linearity error : Deviation of the actual conversion characteristics from a straight line that connects the zero transition point ("0000 0000 0000" ← → "0000 0000 0001") to the full-scale transition point ("1111 1111 1110" ← → "1111 1111 1111").
- Differential linearity error : Deviation of the input voltage from the ideal value that is required to change the output code by 1LSB.

### (3) Notes on Using A/D Converter

<About the output impedance of the analog input of external circuit>

- When the external impedance is too high, the sampling period for analog voltages may not be sufficient. In this case, it is recommended to connect the capacitor (approx. 0.1  $\mu\text{F}$ ) to the analog input pin.

#### • Analog input circuit model

|           | R                   | C            |                                            |
|-----------|---------------------|--------------|--------------------------------------------|
| 12bit A/D | 1.9k $\Omega$ (Max) | 8.30pF (Max) | (4.5V $\leq$ AV <sub>CC</sub> $\leq$ 5.5V) |
|           | 4.3k $\Omega$ (Max) | 8.30pF (Max) | (3.0V $\leq$ AV <sub>CC</sub> $\leq$ 3.6V) |

Note: Listed values must be considered as reference values.

## 6. Flash memory

## (1) Electrical Characteristics

| Erase cycle* <sup>2</sup> /<br>Data retain time | 1,000 cycles/<br>20 years,<br>10,000 cycles/<br>10 years,<br>100,000 cycles/<br>5 years | —   | —    | —    | Average T <sub>A</sub> =+85°C* <sup>3</sup>                             |

\*1: The guaranteed value for erasure up to 100,000 cycles.

\*2: Number of erase cycles for each sector.

\*3: This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at + 85°C).

## (2) Notes

While the Flash memory is written or erased, shutdown of the external power (V<sub>CC</sub>) is prohibited. In the application system where V<sub>CC</sub> might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function.

To put it concretely, after the external power supply voltage falls below the detection voltage (V<sub>DL</sub>\*), hold V<sub>CC</sub> at 2.7V or more within the duration calculated by the following expression:

$$Td^*[\mu s] + (\text{period of PCLK} [\mu s] \times 257) + 50 [\mu s]$$

\*: See “4.AC Characteristics (8) Low-voltage detection (External low-voltage detection)”

## 7. D/A converter

 $(T_A: -40^{\circ}\text{C to } +125^{\circ}\text{C}, V_{CC} = AV_{CC} = 5.0\text{V} \pm 10\% / V_{CC} = AV_{CC} = 3.3\text{V} \pm 0.3\text{V}, V_{SS} = AV_{SS} = 0.0\text{V})$ 

| Parameter                          | Symbol | Pin name | Condition | Value |      |           | Unit             | Remarks                        |
|------------------------------------|--------|----------|-----------|-------|------|-----------|------------------|--------------------------------|
|                                    |        |          |           | Min   | Typ  | Max       |                  |                                |

**■Major Changes**

| Page         | Section | Change Results  |
|--------------|---------|-----------------|
| Revision 1.0 |         |                 |
| -            | -       | Initial release |

**Colophon**

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for any use that includes fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for any use where chance of failure is intolerable (i.e., submersible repeater and artificial satellite). Please note that Spansion will not be liable to you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products. Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions. If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the US Export Administration Regulations or the applicable laws of any other country, the prior authorization by the respective government entity will be required for export of those products.

**Trademarks and Notice**
