

16-bit Proprietary Microcontroller

CMOS

F²MC-16FX MB966A0 Series

MB96F6A6*

■ DESCRIPTION

MB966A0 series is based on FUJITSU's advanced 16FX architecture (16-bit with instruction pipeline for RISC-like performance). The CPU uses the same instruction set as the established 16LX series - thus allowing for easy migration of 16LX Software to the new 16FX products.

16FX improvements compared to the previous generation include significantly improved performance - even at the same operation frequency, reduced power consumption and faster start-up time.

For high processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 32MHz operation frequency from an external 4MHz resonator. The result is a minimum instruction cycle time of 31.2ns going together with excellent EMI behavior. The emitted power is minimized by the on-chip voltage regulator that reduces the internal CPU voltage. A flexible clock tree allows selecting suitable operation frequencies for peripheral resources independent of the CPU speed.

*: These devices are under development and specification is preliminary.

These products under development may change its specification without notice.

Note: F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

For the information for microcontroller supports, see the following website.

<http://edevice.fujitsu.com/micom/en-support/>

■ FEATURES

● Technology

- 0.18µm CMOS

● CPU

- F²MC-16FX CPU
- Optimized instruction set for controller applications
(bit, byte, word and long-word data types, 23 different addressing modes, barrel shift, variety of pointers)
- 8-byte instruction execution queue
- Signed multiply (16-bit × 16-bit) and divide (32-bit/16-bit) instructions available

● System clock

- On-chip PLL clock multiplier (×1 to ×8, ×1 when PLL stop)
- 4 MHz to 8 MHz external crystal oscillator clock
(maximum frequency when using ceramic resonator depends on Q-factor)
- Up to 16 MHz external clock for devices with fast clock input feature
- 32.768 kHz subsystem quartz clock
- 100kHz/2MHz internal RC clock for quick and safe startup, oscillator stop detection, watchdog
- Clock source selectable from mainclock oscillator, subclock oscillator and on-chip RC oscillator, independently for CPU and 2 clock domains of peripherals
- The subclock oscillator is enabled by the Boot ROM program controlled by a configuration marker after a Power or External reset
- Low Power Consumption - 13 operating modes (different Run, Sleep, Timer modes, Stop mode)

● On-chip voltage regulator

- Internal voltage regulator supports reduced internal MCU voltage, offering low EMI and low power consumption figures

● Low voltage reset

- Reset is generated when supply voltage is below minimum

● Code Security

- Protects Flash Memory content from unintended read-out

● DMA

- Automatic transfer function independent of CPU, can be assigned freely to resources

● Interrupts

- Fast Interrupt processing
- 8 programmable priority levels
- Non-Maskable Interrupt (NMI)

● CAN

- Supports CAN protocol version 2.0 part A and B
- ISO16845 certified
- Bit rates up to 1 Mbit/s
- 32 message objects
- Each message object has its own identifier mask
- Programmable FIFO mode (concatenation of message objects)
- Maskable interrupt
- Disabled Automatic Retransmission mode for Time Triggered CAN applications
- Programmable loop-back mode for self-test operation

● USART

- Full duplex USARTs (SCI/LIN)
- Wide range of baud rate settings using a dedicated reload timer
- Special synchronous options for adapting to different synchronous serial protocols
- LIN functionality working either as master or slave LIN device
- Extended support for LIN-Protocol with 16-byte FIFO for selected channels to reduce interrupt load

● I²C

- Up to 400 kbps
- Master and Slave functionality, 7-bit and 10-bit addressing

● A/D converter

- SAR-type
- 8/10-bit resolution
- Signals interrupt on conversion end, single conversion mode, continuous conversion mode, stop conversion mode, activation by software, external trigger, reload timers and PPGs
- Range Comparator Function
- Scan Disable Function
- ADC Pulse Detection Function

● Source Clock Timers

- Three independent clock timers (23-bit RC clock timer, 23-bit Main clock timer, 17-bit Sub clock timer)

● Hardware Watchdog Timer

- Hardware watchdog timer is active after reset
- Window function of Watchdog Timer is used to select the lower window limit of the watchdog interval

● Reload Timers

- 16-bit wide
- Prescaler with $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$ of peripheral clock frequency
- Event count function

● Free Running Timers

- Signals an interrupt on overflow
- Prescaler with 1, $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$, $1/2^7$, $1/2^8$ of peripheral clock frequency

● Input Capture Units

- 16-bit wide
- Signals an interrupt upon external event
- Rising edge, Falling edge or Both (rising&falling) edges sensitive

● Output Compare Units

- 16-bit wide
- Signals an interrupt when a match with 16-bit I/O Timer occurs
- A pair of compare registers can be used to generate an output signal

● Programmable Pulse Generator

- 16-bit down counter, cycle and duty setting registers
- Can be used as 2×8 -bit PPG
- Interrupt at trigger, counter borrow and/or duty match
- PWM operation and one-shot operation
- Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock or of selected Reload timer underflow as clock input
- Can be triggered by software or reload timer
- Can trigger ADC conversion
- Timing point capture
- Start delay

● Stepper Motor Controller

- Stepper Motor Controller with integrated high current output drivers
- Four high current outputs for each channel
- Two synchronized 8/10-bit PWMs per channel
- Internal prescaling for PWM clock: 1, 1/4, 1/5, 1/6, 1/8, 1/10, 1/12, 1/16 of peripheral clock
- Dedicated power supply for high current output drivers

● LCD Controller

- LCD controller with up to 4 COM \times 44SEG
- Internal or external voltage generation
- Duty cycle: Selectable from options: 1/2, 1/3 and 1/4
- Fixed 1/3 bias
- Programmable frame period
- Clock source selectable from four options (main clock, peripheral clock, subclock or RC oscillator clock)
- On-chip drivers for internal divider resistors or external divider resistors
- On-chip data memory for display
- LCD display can be operated in Timer Mode
- Blank display: selectable
- All SEG, COM and V pins can be switched between general and specialized purposes

● Sound Generator

- 8-bit PWM signal is mixed with tone frequency from 16-bit reload counter
- PWM clock by internal prescaler: 1, 1/2, 1/4, 1/8 of peripheral clock

● Real Time Clock

- Operational on main oscillation (4MHz), sub oscillation (32kHz) or RC oscillation (100kHz/2MHz)
- Capable to correct oscillation deviation of Sub clock or RC oscillator clock (clock calibration)
- Read/write accessible second/minute/hour registers
- Can signal interrupts every half second/second/minute/hour/day
- Internal clock divider and prescaler provide exact 1s clock

● External Interrupts

- Edge or Level sensitive
- Interrupt mask and pending bit per channel
- Each available CAN channel RX has an external interrupt for wake-up
- Selected USART channels SIN have an external interrupt for wake-up

● Non Maskable Interrupt

- Disabled after reset, can be enabled by Boot-ROM depending on ROM configuration block
- Once enabled, can not be disabled other than by reset
- High or Low level sensitive
- Pin shared with external interrupt 0

● I/O Ports

- Most of the external pins can be used as general purpose I/O
- All push-pull outputs (except when used as I²C SDA/SCL line)
- Bit-wise programmable as input/output or peripheral signal
- Bit-wise programmable input enable
- One input level per GP-IO-pin (either Automotive or CMOS-Schmitt trigger)
- Bit-wise programmable pull-up resistor

● Built-in OCD (On Chip Debugger)

- One-wire debug tool interface
- Break function:
 - Hardware break: 6 points (shared with code event)
 - Software break: 4096 points
- Event function
 - Code event: 6 points (shared with hardware break)
 - Data event: 6 points
 - Event sequencer: 2 levels
- Execution time measurement function
- Trace function: 42 branches
- Security function

● Flash Memory

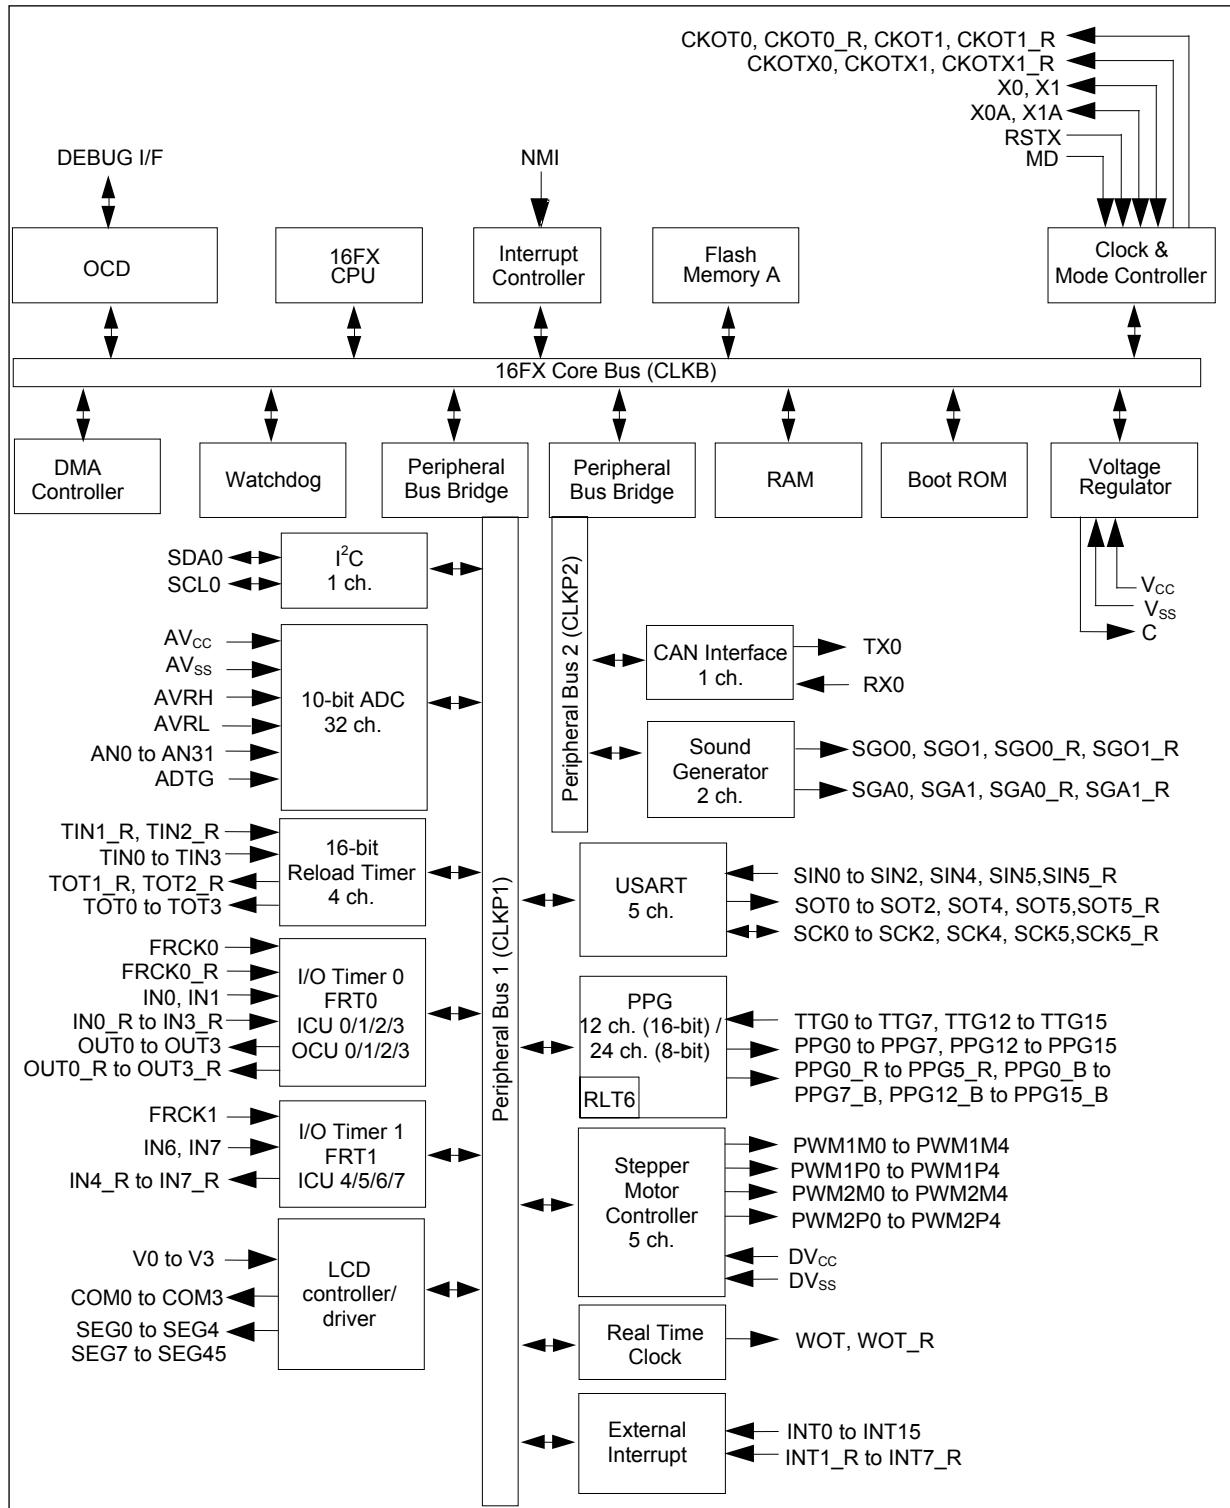

- Dual operation flash allowing reading of one Flash bank while programming or erasing the other bank
- Command sequencer for automatic execution of programming algorithm and for supporting DMA for programming of the Flash Memory
- Supports automatic programming, Embedded Algorithm
- Write/Erase/Erase-Suspend/Resume commands
- A flag indicating completion of the algorithm
- Erase can be performed on each sector individually
- Sector protection
- Flash Security feature to protect the content of the Flash
- Low voltage detection during Flash erase

■ PRODUCT LINEUP

Features	MB96F6Ax	Remark
Product type	Flash product	
Subclock	Subclock can be set by software	
Dual Operation Flash memory	RAM	
256.5KB + 32KB	16KB	MB96F6A6
Package	LQFP-120 FPT-120P-M21	
DMA	4ch	
USART	5ch	LIN-USART 0/1/2/4/5
with automatic LIN-Header transmission/reception	2ch	LIN-USART 0/1
with 16 byte RX- and TX-FIFO		
I ² C	1ch	I ² C 0
10-bit A/D Converter	32ch	AN 0 to 31
with Data Buffer	No	
with Range Comparator	Yes	
with Scan Disable	Yes	
with ADC Pulse Detection	Yes	
16-bit Reload Timer (RLT)	5ch	RLT 0/1/2/3/6 Only RLT6 can be used as PPG clock source.
16-bit Free-Running Timer (FRT)	2ch	FRT 0/1
16-bit Input Capture Unit (ICU)	8ch (5 channels for LIN-USART)	ICU 0 to 7 ICU 0/1/4/5/6 for LIN-USART
16-bit Output Compare Unit (OCU)	4ch	OCU 0 to 3
8/16-bit Programmable Pulse Generator (PPG)	12ch (16-bit) / 24ch (8-bit)	PPG 0 to 7/12 to 15
with Timing point capture	Yes	
with Start delay	Yes	
with Ramp	No	
CAN Interface	1ch	CAN 0 32 Message Buffers
Stepping Motor Controller (SMC)	5ch	SMC 0 to 4
External Interrupts (INTerrupt)	16ch	INT 0 to 15
Non-Maskable Interrupt (NMI)	1ch	
Sound generator (SG)	2ch	SG 0/1
LCD Controller	4 COM × 44 SEG	COM 0 to 3 SEG 0 to 4/7 to 45
Real Time Clock (RTC)	1ch	
I/O Ports	96 (Dual clock mode) 98 (Single clock mode)	
Clock Calibration Unit (CAL)	1ch	
Clock Output Function	2ch	
Low Voltage Reset	Yes	Low voltage reset can be disabled by software
Hardware Watchdog Timer	Yes	
On-chip RC-oscillator	Yes	
On-chip Debugger	Yes	

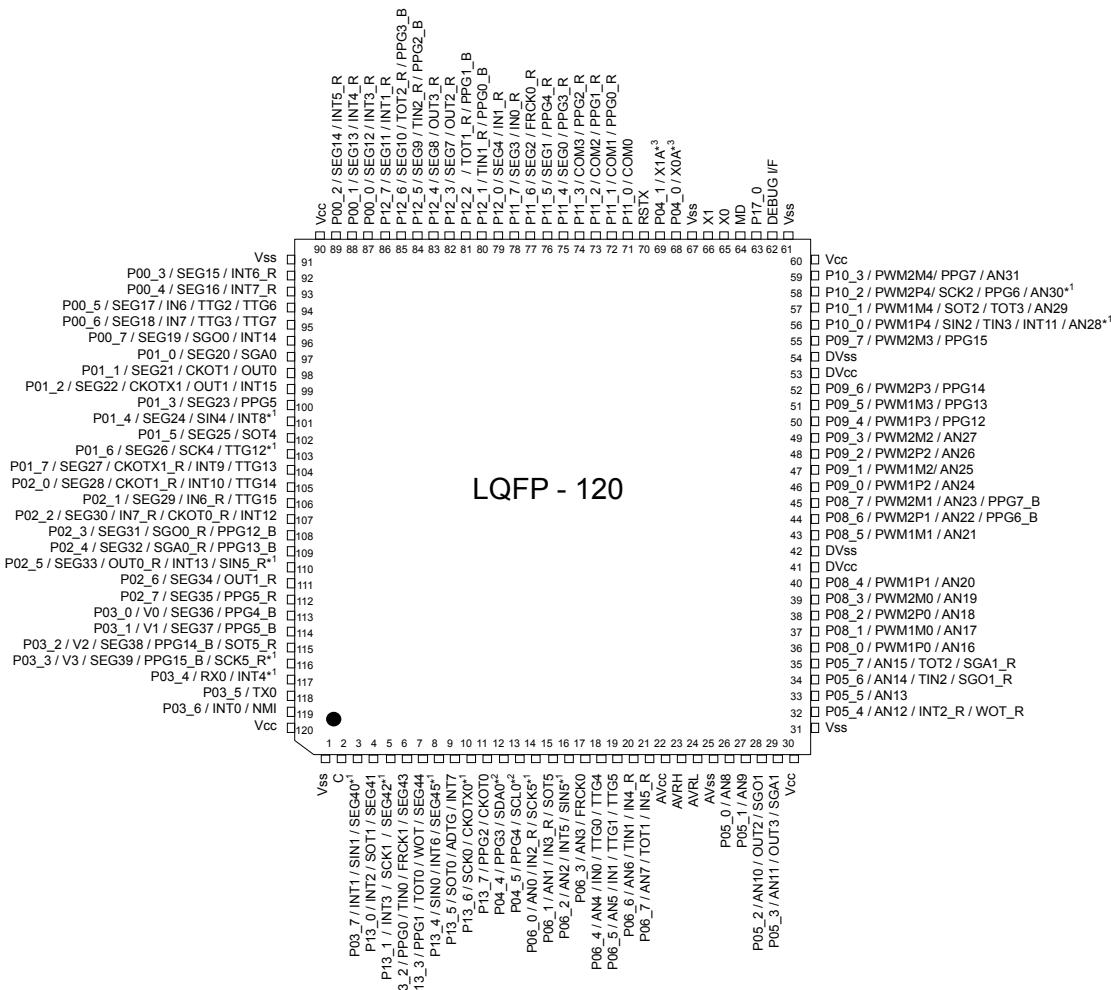

- Notes:
- All signals of the peripheral function in each product cannot be allocated by limiting the pins of package. It is necessary to use the port relocate function of the General I/O port according to your function use.
 - These devices are under development and specification is preliminary.
These products under development may change its specification without notice.

■ BLOCK DIAGRAM

■ PIN ASSIGNMENTS

(TOP VIEW)

¹: CMOS input level only²: CMOS input level only for I²C³: Please set Rom Configuration Block (RCB) to use the subclock.

All other general-purpose pins have only Automotive input level.

■ PIN FUNCTION DESCRIPTION

Pin name	Feature	Description
ADTG	ADC	A/D converter trigger input
ANn	ADC	A/D converter channel n input
AVcc	Supply	Analog circuits power supply
AVRH	ADC	A/D converter high reference voltage input
AVRL	ADC	A/D converter low reference voltage input
AVss	Supply	Analog circuits power supply
C	Voltage regulator	Internally regulated power supply stabilization capacitor pin
CKOTn	Clock output function	Clock Output function n output
CKOTn_R	Clock output function	Relocated Clock Output function n output
CKOTXn	Clock output function	Clock Output function n inverted output
CKOTXn_R	Clock output function	Relocated Clock Output function n inverted output
COMn	LCD	LCD Common driver
DVcc	Supply	SMC pins power supply
DVss	Supply	SMC pins power supply
FRCKn	Free Running Timer	Free Running Timer n input
FRCKn_R	Free Running Timer	Relocated Free Running Timer n input
INn	ICU	Input Capture Unit n input
INn_R	ICU	Relocated Input Capture Unit n input
INTn	External Interrupt	External Interrupt n input
INTn_R	External Interrupt	Relocated External Interrupt n input
MD	Core	Input pin for specifying the operating mode
NMI	External Interrupt	Non-Maskable Interrupt input
Pnn_m	GPIO	General purpose I/O
OUTn	OCU	Output Compare Unit n waveform output
OUTn_R	OCU	Relocated Output Compare Unit n waveform output
PPGn	PPG	Programmable Pulse Generator n output (16bit/8bit)
PPGn_R	PPG	Relocated Programmable Pulse Generator n output (16bit/8bit)
PPGn_B	PPG	Programmable Pulse Generator n output (8bit)
PWMn	SMC	SMC PWM high current output
RSTX	Core	Reset input
RXn	CAN	CAN interface n RX input
SCKn	USART	USART n serial clock input/output
SCKn_R	USART	Relocated USART n serial clock input/output
SCLn	I ² C	I ² C interface n clock I/O input/output
SDAn	I ² C	I ² C interface n serial data I/O input/output
SEGn	LCD	LCD Segment driver
SGAn	Sound Generator	SG amplitude output
SGAn_R	Sound Generator	Relocated SG amplitude output
SGOn	Sound Generator	SG sound/tone output
SGOn_R	Sound Generator	Relocated SG sound/tone output
SINn	USART	USART n serial data input
SINn_R	USART	Relocated USART n serial data input
SOTn	USART	USART n serial data output
SOTn_R	USART	Relocated USART n serial data output

Pin name	Feature	Description
TINn	Reload Timer	Reload Timer n event input
TINn_R	Reload Timer	Relocated Reload Timer n event input
TOTn	Reload Timer	Reload Timer n output
TOT_R	Reload Timer	Relocated Reload Timer n output
TTGn	PPG	Programmable Pulse Generator n trigger input
TXn	CAN	CAN interface n TX output
Vn	LCD	LCD voltage reference
Vcc	Supply	Power supply
Vss	Supply	Power supply
WOT	RTC	Real Time clock output
WOT_R	RTC	Relocated Real Time clock output
X0	Clock	Oscillator input
X0A	Clock	Subclock Oscillator input
X1	Clock	Oscillator output
X1A	Clock	Subclock Oscillator output
DEBUG I/F	OCD	On Chip Debugger input/output

■ PIN CIRCUIT TYPE

Pin no.	I/O circuit type*	Pin name
1	Supply	Vss
2	F	C
3	P	P03_7 / INT1 / SIN1 / SEG40
4	J	P13_0 / INT2 / SOT1 / SEG41
5	P	P13_1 / INT3 / SCK1 / SEG42
6	J	P13_2 / PPG0 / TIN0 / FRCK1 / SEG43
7	J	P13_3 / PPG1 / TOT0 / WOT / SEG44
8	P	P13_4 / SIN0 / INT6 / SEG45
9	H	P13_5 / SOT0 / ADTG / INT7
10	M	P13_6 / SCK0 / CKOTX0
11	H	P13_7 / PPG2 / CKOT0
12	N	P04_4 / PPG3 / SDA0
13	N	P04_5 / PPG4 / SCL0

117	M	P03_4 / RX0 / INT4
118	H	P03_5 / TX0
119	H	P03_6 / INT0 / NMI
120	Supply	Vcc

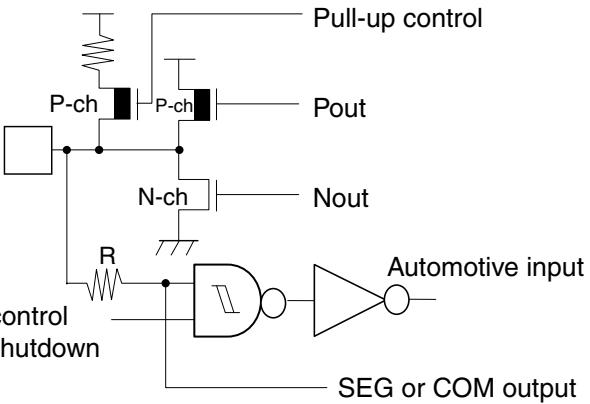

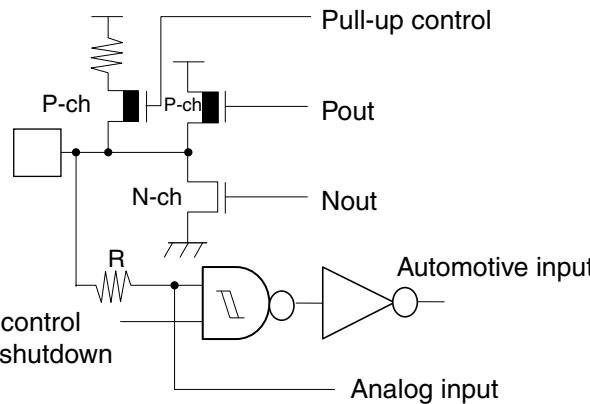

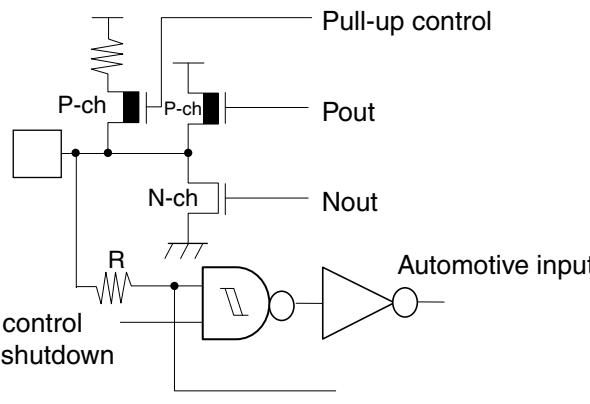

*: Please refer to “■ I/O CIRCUIT TYPE” for details on the I/O circuit types.

■ I/O CIRCUIT TYPE

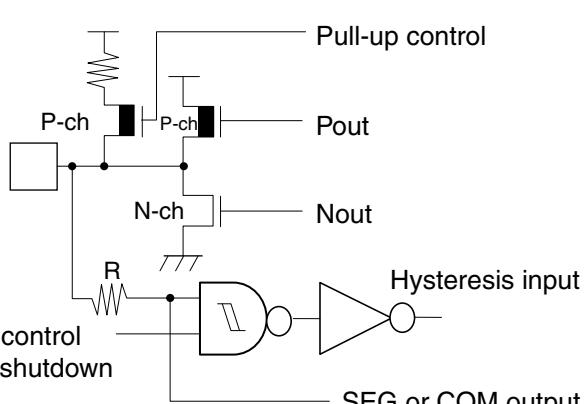

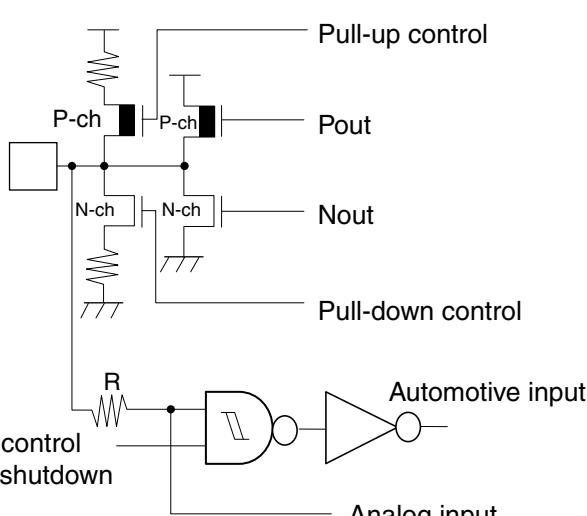

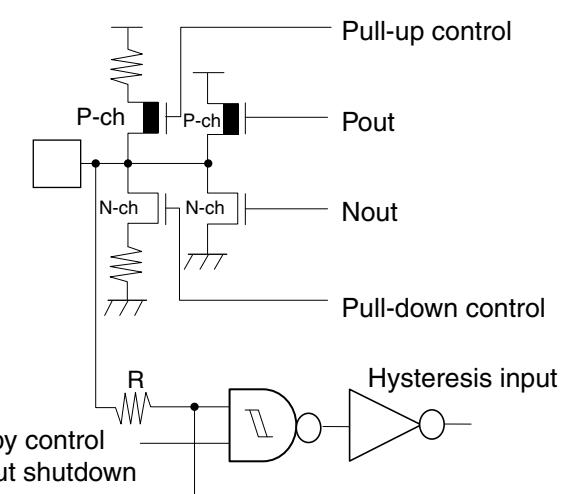

Type	Circuit	Remarks
A	<p>FCI or osc disable</p> <p>X out</p> <p>0 1</p> <p>FCI</p>	<p>High-speed oscillation circuit:</p> <ul style="list-style-type: none"> Programmable between oscillation mode (external crystal or resonator connected to X0/X1 pins) and Fast external Clock Input (FCI) mode (external clock connected to X0 pin) Feedback resistor = approx. 1.0 MΩ. Feedback resistor is grounded in the center when the oscillator is disabled or in FCI mode The amplitude: 1.8V±0.15V to operate by the internal supply voltage

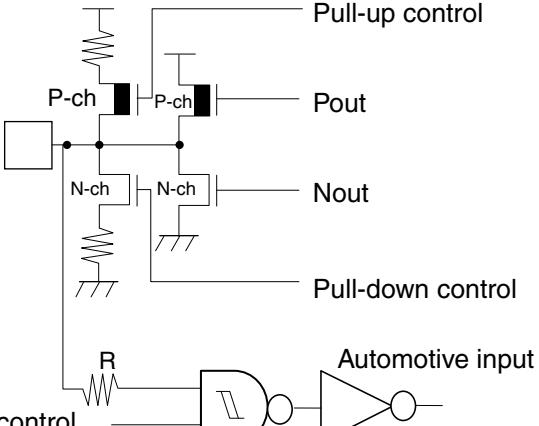

Type	Circuit	Remarks
B	<p>The circuit diagram for Type B shows two parallel oscillator paths. Each path consists of a resistor (R) connected between the output and ground. The outputs of these resistors are connected to the non-inverting inputs of two operational amplifiers. The inverting inputs of these amplifiers are connected to the outputs of two comparators. The outputs of the comparators are connected to a 2-to-1 multiplexer (FCI). The FCI has two inputs: one from the X1A path and one from the X0A path. The output of the FCI is connected to a digital switch. The digital switch has two states: '0' and '1'. When the switch is at '0', it connects the output of the FCI to the inverting input of a third operational amplifier. This operational amplifier has its non-inverting input connected to the output of the FCI. Its output is connected to the Pout pin. A P-channel MOSFET is connected between the Pout pin and ground. The gate of this P-channel MOSFET is controlled by the output of the third operational amplifier. A N-channel MOSFET is also connected between the Pout pin and ground, with its gate controlled by the output of the second operational amplifier. The Nout pin is connected to the drain of the N-channel MOSFET. A feedback resistor (R) is connected between the Pout pin and the inverting input of the second operational amplifier. The inverting input of the second operational amplifier is also connected to a hysteresis input. The hysteresis input is controlled by a standby control for input shutdown. The X1A and X0A inputs are also controlled by a standby control for input shutdown.</p>	<p>Low-speed oscillation circuit shared with GPIO functionality:</p> <ul style="list-style-type: none"> Feedback resistor = approx. 5.0 MΩ. Feedback resistor is grounded in the center when the oscillator is disabled GPIO functionality selectable (CMOS hysteresis input with input shutdown function, $I_{OL} = 4\text{mA}$, $I_{OH} = -4\text{mA}$, Programmable pull-up resistor)
C	<p>The circuit diagram for Type C shows a simplified configuration. It consists of a resistor (R) connected between the output and ground. The output is connected to the non-inverting input of a operational amplifier. The inverting input of the operational amplifier is connected to the output of the operational amplifier. This creates a hysteresis input stage. The output of the operational amplifier is connected to the Hysteresis inputs pin.</p>	<ul style="list-style-type: none"> CMOS hysteresis input pin

Type	Circuit	Remarks
F		<ul style="list-style-type: none"> Power supply input protection circuit
G		<ul style="list-style-type: none"> A/D converter ref+ (AVRH) power supply input pin with protection circuit Without protection circuit against V_{CC} for pins AVRH
H		<ul style="list-style-type: none"> CMOS level output ($I_{OL} = 4mA$, $I_{OH} = -4mA$) Automotive input with input shutdown function Programmable pull-up resistor
I		<ul style="list-style-type: none"> CMOS level output ($I_{OL} = 4mA$, $I_{OH} = -4mA$) CMOS hysteresis input with input shutdown function Programmable pull-up resistor Analog input

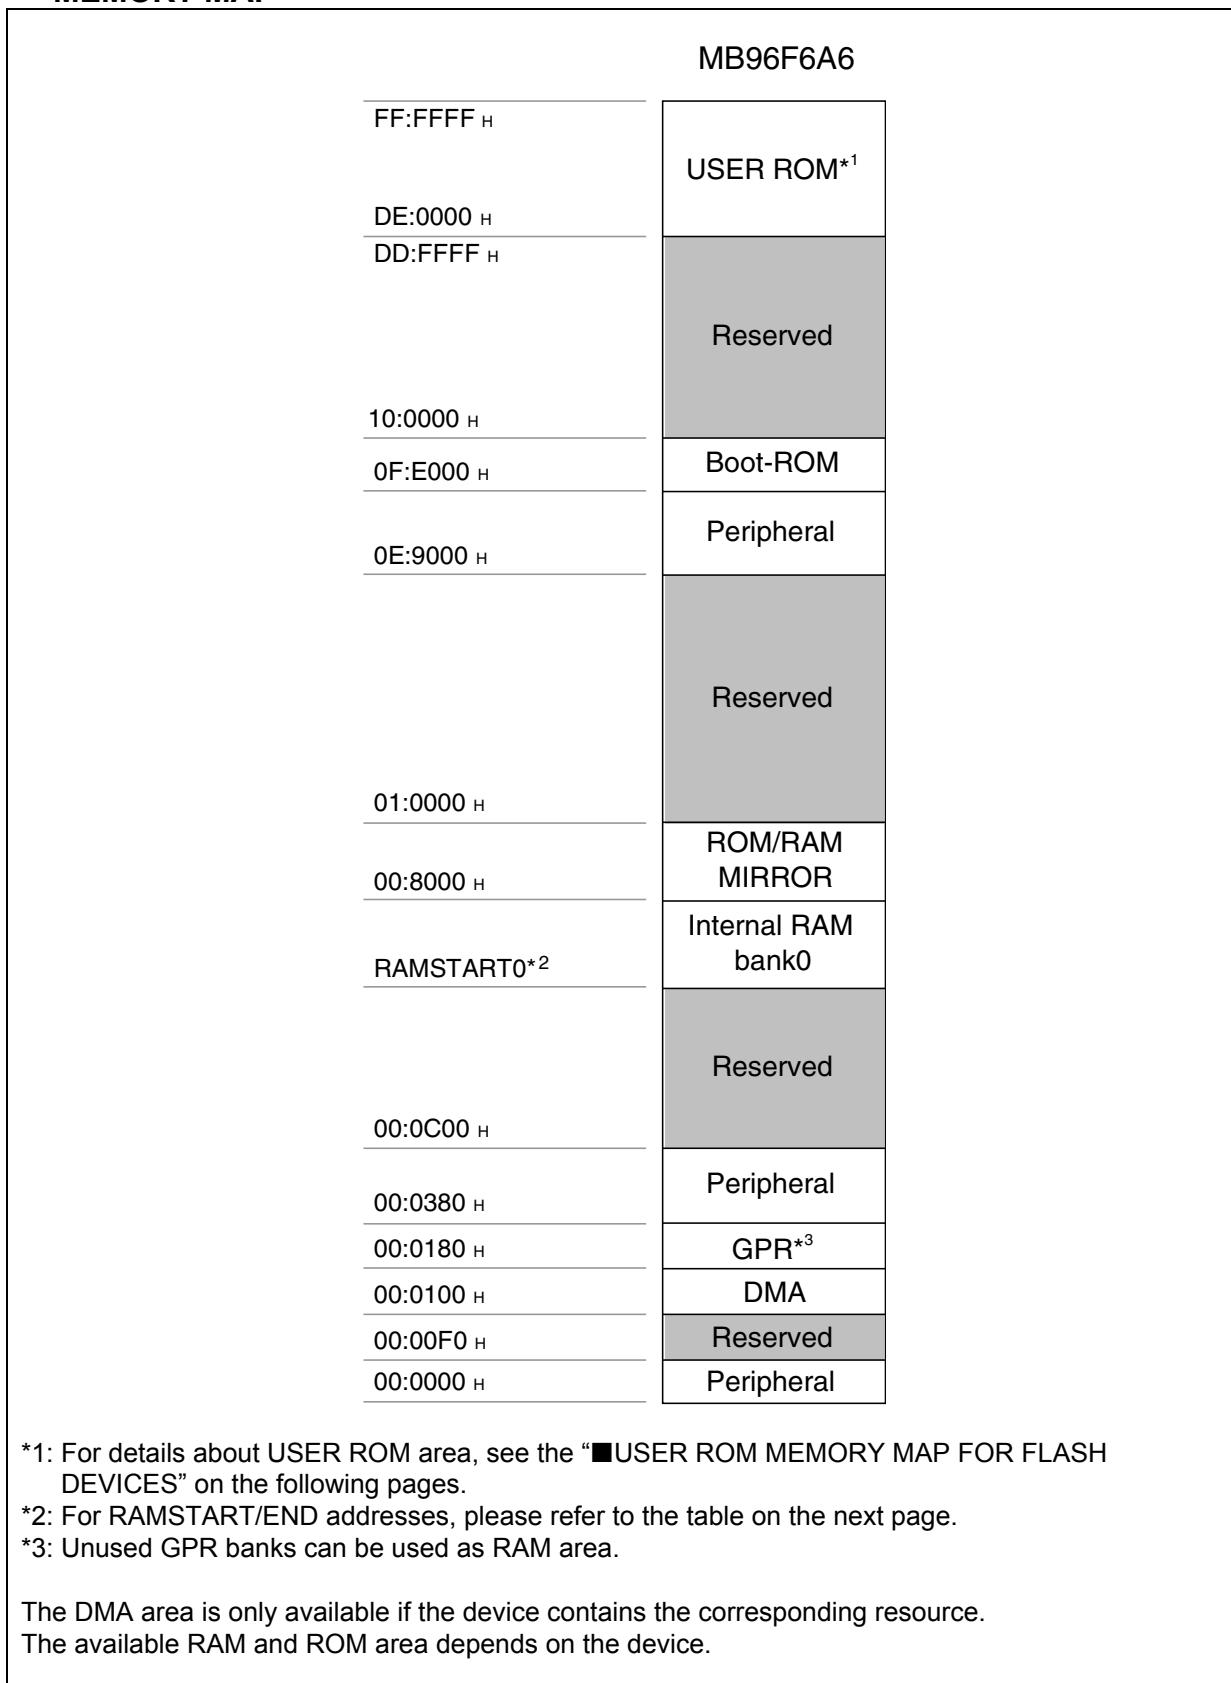

Type	Circuit	Remarks
J	 <p>The circuit diagram shows a CMOS level output stage. It consists of two P-channel MOSFETs (P-ch) connected in series with a resistor R. The drain of the top P-channel is connected to the drain of a N-channel MOSFET (N-ch). The source of the N-ch is connected to ground. The drain of the N-ch is connected to the output Pout. The source of the P-ch is connected to the output Nout. A feedback loop from the output Pout goes through a P-channel MOSFET back to the gate of the N-ch. A logic input (Standby control for input shutdown) is connected to the gate of the P-ch. An automotive input signal is connected to the gate of the N-ch. The outputs Pout and Nout are labeled as SEG or COM output.</p>	<ul style="list-style-type: none"> CMOS level output ($I_{OL} = 4mA$, $I_{OH} = -4mA$) Automotive input with input shutdown function Programmable pull-up resistor SEG or COM output
K	 <p>The circuit diagram shows a CMOS level output stage similar to Type J, but it includes an additional stage for an analog input. The analog input signal is connected to the gate of the N-channel MOSFET. The outputs Pout and Nout are labeled as Analog input.</p>	<ul style="list-style-type: none"> CMOS level output ($I_{OL} = 4mA$, $I_{OH} = -4mA$) Automotive input with input shutdown function Programmable pull-up resistor Analog input
L	 <p>The circuit diagram shows a CMOS level output stage similar to Type J, but it includes an additional stage for a Vx input. The Vx input signal is connected to the gate of the N-channel MOSFET. Type	Circuit	Remarks
T	 <p>The circuit diagram illustrates a CMOS level output structure. It features two parallel branches: a top branch with a P-channel MOSFET (P-ch) and a bottom branch with an N-channel MOSFET (N-ch). Both branches are connected to a common drain node. A resistor is connected between the drain node and ground. The gate of the P-ch is controlled by a 'Pull-up control' signal, and the gate of the N-ch is controlled by a 'Pull-down control' signal. The output nodes are labeled Pout and Nout. Below the main structure, an 'Automotive input' section is shown, consisting of a diode (represented by a triangle) and an inverter. A 'Standby control for input shutdown' signal is connected to the inverter's input. The inverter's output is connected to the gate of the P-ch and the drain of the N-ch.</p>	<ul style="list-style-type: none"> CMOS level output (programmable $I_{OL} = 4\text{mA}$, $I_{OH} = -4\text{mA}$ and $I_{OL} = 30\text{mA}$, $I_{OH} = -30\text{mA}$) Automotive input with input shutdown function Programmable pull-up / pull-down resistor

■ HANDLING DEVICES

Special care is required for the following when handling the device:

- Latch-up prevention
- Unused pins handling
- External clock usage
- Notes on PLL clock mode operation
- Power supply pins (V_{CC}/V_{SS})
- Crystal oscillator circuit
- Turn on sequence of power supply to A/D converter and analog inputs
- Pin handling when not using the A/D converter
- Notes on Power-on
- Stabilization of power supply voltage
- SMC power supply pins
- Serial communication

1. Latch-up prevention

CMOS IC chips may suffer latch-up under the following conditions:

- A voltage higher than V_{CC} or lower than V_{SS} is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between V_{CC} pins and V_{SS} pins.
- The AV_{CC} power supply is applied before the V_{CC} voltage.

Latch-up may increase the power supply current dramatically, causing thermal damages to the device.

For the same reason, extra care is required to not let the analog power-supply voltage (AV_{CC} , AVRH) exceed the digital power-supply voltage.

2. Unused pins handling

Unused input pins can be left open when the input is disabled (corresponding bit of Port Input Enable register PIER = 0).

Leaving unused input pins open when the input is enabled may result in misbehavior and possible permanent damage of the device. They must therefore be pulled up or pulled down through resistors. To prevent latch-up, those resistors should be more than $2\text{ k}\Omega$.

Unused bidirectional pins can be set either to the output state and be then left open, or to the input state with either input disabled or external pull-up/pull-down resistor as described above.

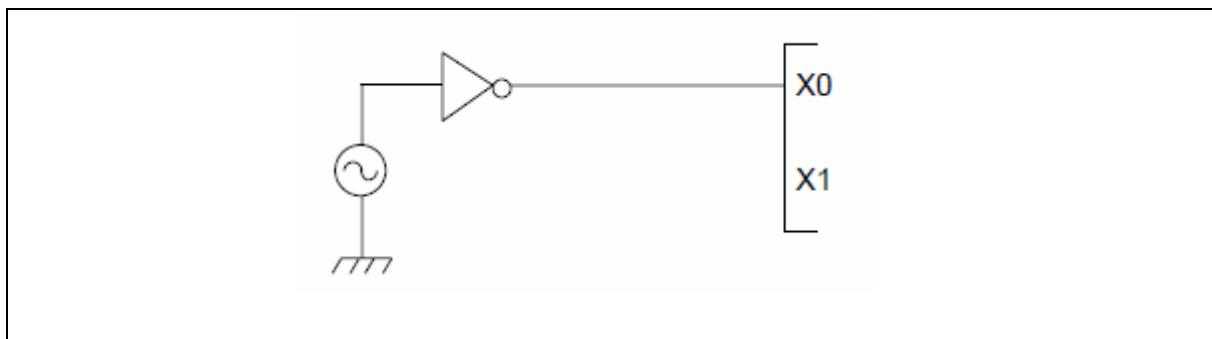

3. External clock usage

The permitted frequency range of an external clock depends on the oscillator type and configuration.

See AC Characteristics for detailed modes and frequency limits. Single and opposite phase external clocks must be connected as follows:

1. Single phase external clock for Main oscillator

- When using a single phase external clock for the Main oscillator, X0 pin must be driven and X1 pin left open. And supply 1.8V power to the external clock.

2. Single phase external clock for Sub oscillator

- When using a single phase external clock for the Sub oscillator, ‘External clock mode’ must be selected and X0A/GP04_0 must be driven. X1A/GP04_1 must be configured as GPIO.

4. Notes on PLL clock mode operation

If the PLL clock mode is selected and no external oscillator is operating or no external clock is supplied, the microcontroller attempts to work with the free oscillating PLL. Performance of this operation, however, cannot be guaranteed.

5. Power supply pins (V_{CC}/V_{SS})

It is required that all V_{CC} -level as well as all V_{SS} -level power supply pins are at the same potential. If there is more than one V_{CC} or V_{SS} level, the device may operate incorrectly or be damaged even within the guaranteed operating range.

V_{CC} and V_{SS} must be connected to the device from the power supply with lowest possible impedance. As a measure against power supply noise, it is required to connect a bypass capacitor of about $0.1\ \mu F$ between V_{CC} and V_{SS} as close as possible to V_{CC} and V_{SS} pins.

6. Crystal oscillator and ceramic resonator circuit

Noise at X0, X1 pins or X0A, X1A pins might cause abnormal operation. It is required to provide bypass capacitors with shortest possible distance to X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic resonator) and ground lines, and, to the utmost effort, that the lines of oscillation circuit do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

It is highly recommended to evaluate the quartz/MCU or resonator/MCU system at the quartz or resonator manufacturer, especially when using low-Q resonators at higher frequencies.

7. Turn on sequence of power supply to A/D converter and analog inputs

It is required to turn the A/D converter power supply (AV_{CC} , $AVRH$, $AVRL$) and analog inputs (AN_n) on after turning the digital power supply (V_{CC}) on.

It is also required to turn the digital power off after turning the A/D converter supply and analog inputs off. In this case, the voltage must not exceed $AVRH$ or AV_{CC} (turning the analog and digital power supplies simultaneously on or off is acceptable).

8. Pin handling when not using the A/D converter

It is required to connect the unused pins of the A/D converter as $AV_{CC} = V_{CC}$, $AV_{SS} = AVRH = AVRL = V_{SS}$.

9. Notes on Power-on

To prevent malfunction of the internal voltage regulator, supply voltage profile while turning the power supply on should be slower than $50\ \mu s$ from $0.2V$ to $2.7V$.

10. Stabilization of power supply voltage

If the power supply voltage varies acutely even within the operation safety range of the V_{CC} power supply voltage, a malfunction may occur. The V_{CC} power supply voltage must therefore be stabilized. As stabilization guidelines, the power supply voltage must be stabilized in such a way that V_{CC} ripple fluctuations (peak to peak value) in the commercial frequencies (50 Hz to 60 Hz) fall within 10% of the standard V_{CC} power supply voltage and the transient fluctuation rate becomes $0.1V/\mu s$ or less in instantaneous fluctuation for power supply switching.

11. SMC power supply pins

All DV_{CC}/DV_{SS} pins must be set to the same level as the V_{CC}/V_{SS} pins.

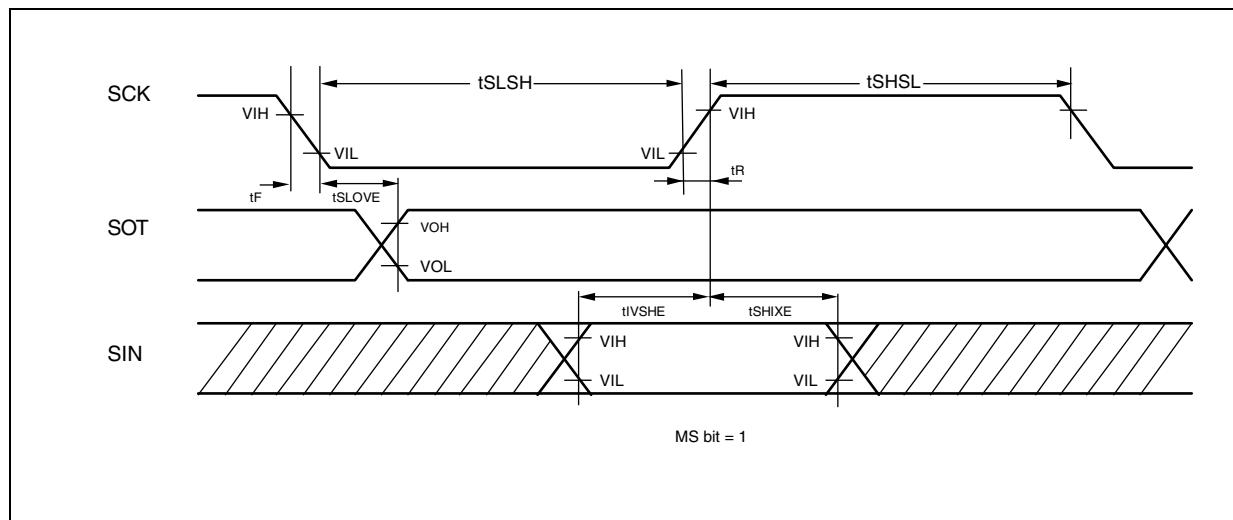

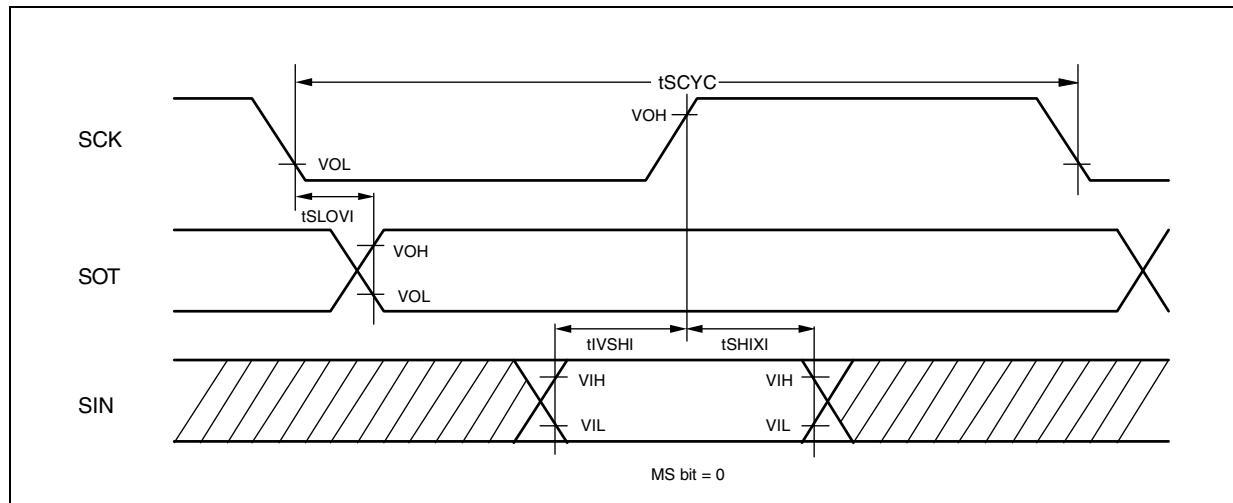

However note that the SMC I/O pin state is undefined if DV_{CC} is powered on and V_{CC} is below 3V. To avoid this, we recommend to always power V_{CC} before DV_{CC}.

12. Serial communication

There is a possibility to receive wrong data due to noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

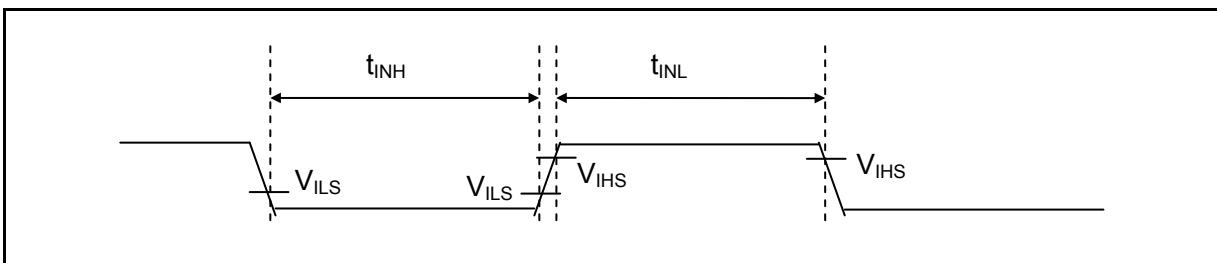

Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

(9) External input timing

 $(V_{CC} = AV_{CC} = DV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = DV_{SS} = 0V, T_A = -40^\circ\text{C} \text{ to } +105^\circ\text{C})$

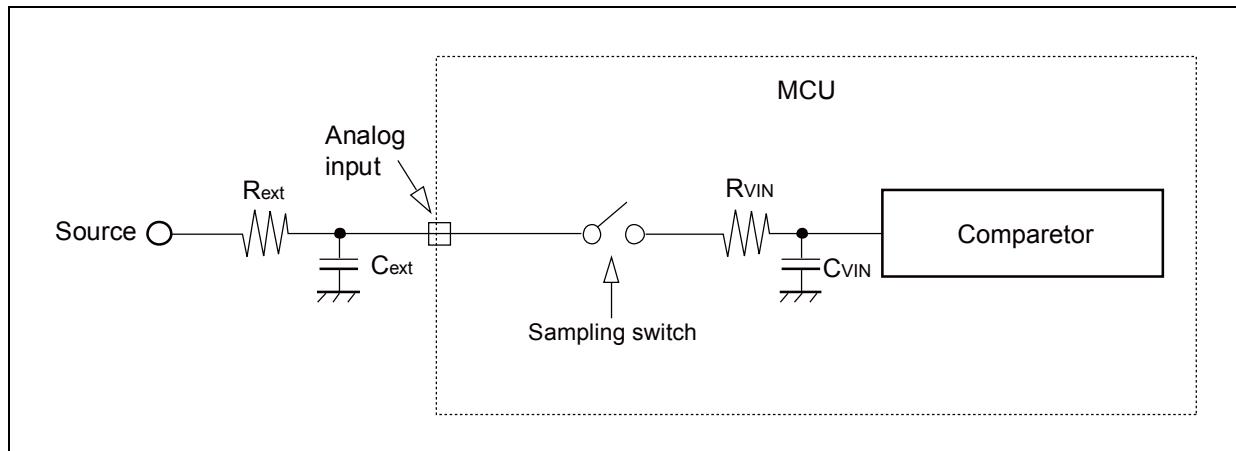

Parameter	Symbol	Pin name	Value		Unit	Remarks
			Min	Max		
Input pulse width	t_{INH} t_{INL}	Pnn_m	$2t_{CLKP1} + 200$ ($t_{CLKP1} = 1/f_{CLKP1}$)*	-	ns	General Purpose I/O
		ADTG				A/D converter trigger input
		FRCKn, FRCKn_R				Free-Running Timer
		TINn, TINn_R				Reload Timer
		TTGn				PPG Trigger input
		INn, INn_R				Input capture
		INTn, INTn_R, NMI	200	-	ns	External interrupt NMI

*: t_{CLKP1} indicates the peripheral clock1 (CLKP1) cycle time except stop when in stop mode.

Accuracy and setting of the A/D Converter sampling time

If the external impedance is too high or the sampling time too short, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting the A/D conversion precision.

To satisfy the A/D conversion precision, a sufficient sampling time must be selected. The required sampling time depends on the external driving impedance R_{ext} , the board capacitance of the A/D converter input pin C_{ext} and the AV_{cc} voltage level. The following replacement model can be used for the calculation:

R_{ext} : External driving impedance

C_{ext} : Capacitance of PCB at A/D converter input

C_{VIN} : Capacitance of MCU input pin (I/O, analog switch and ADC are contained)

16.0pF (Normal outputs), 17.8pF (High current outputs)

R_{VIN} : Analog input impedance (I/O, analog switch and ADC are contained)

2050Ω ($4.5V \leq AV_{cc} \leq 5.5V$), 3600Ω ($2.7V \leq AV_{cc} < 4.5V$)

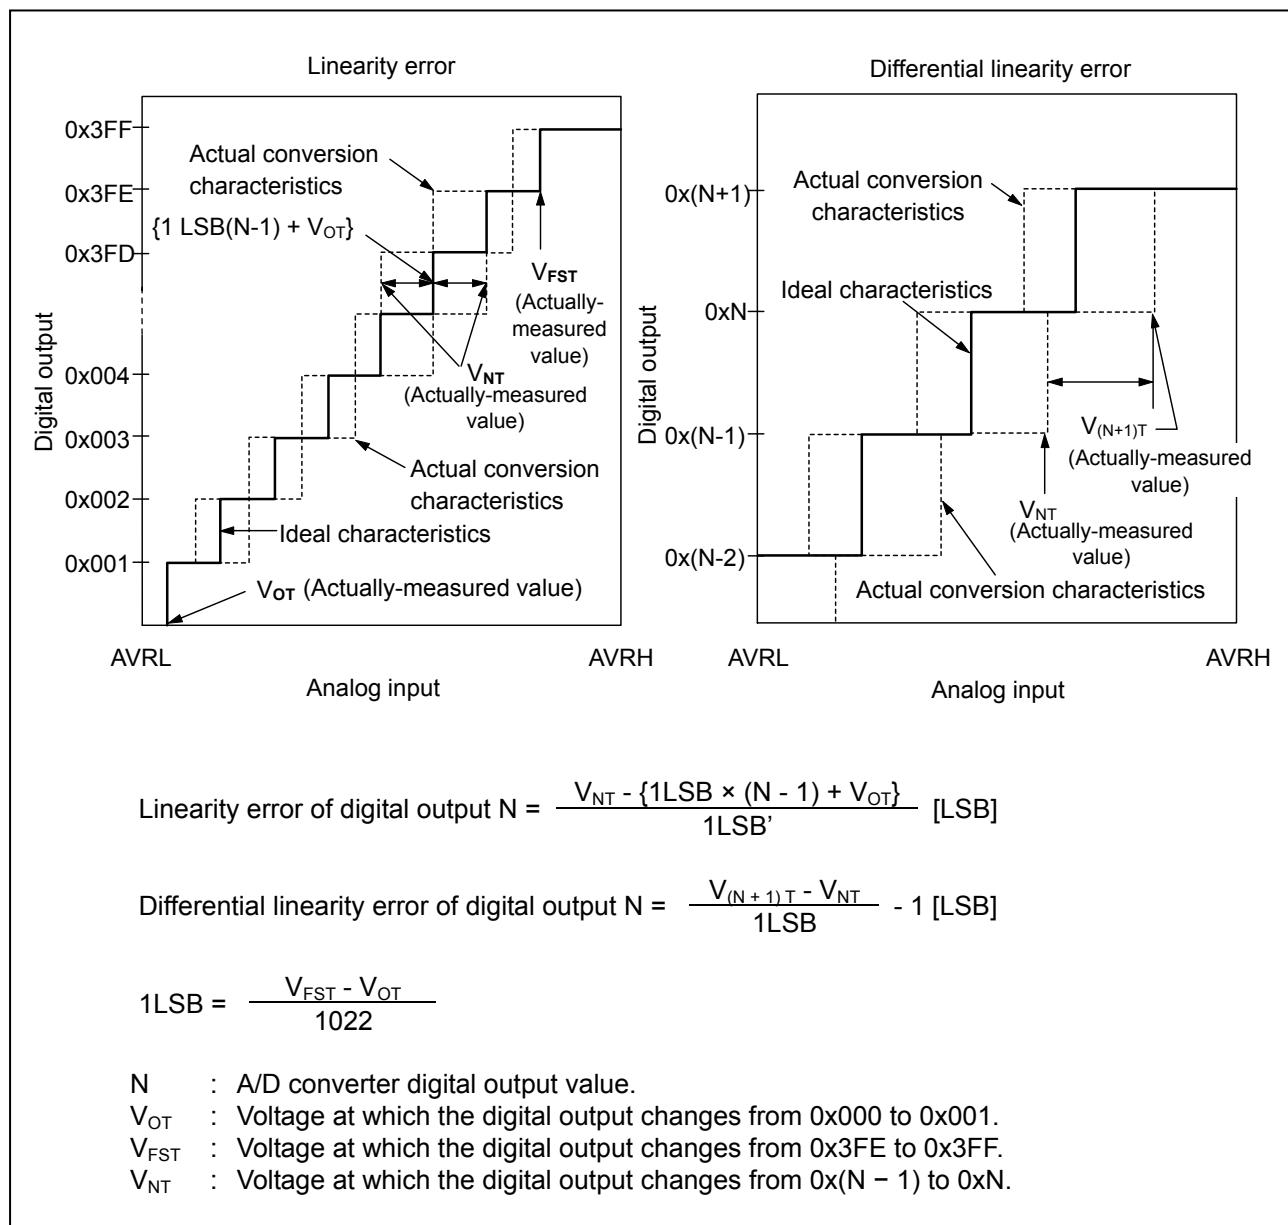

The following approximation formula for the replacement model above can be used:

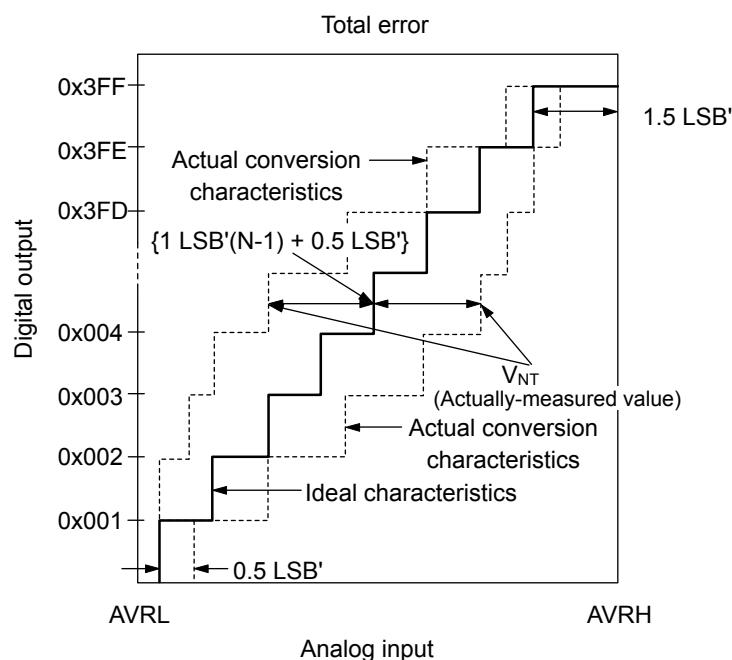

$$Tsamp [\text{min}] = 7.62 \times (R_{ext} \times C_{ext} + (R_{ext} + R_{VIN}) \times C_{VIN})$$

- Do not select a sampling time below the absolute minimum permitted value.
($0.5\mu s$ for $4.5V \leq AV_{cc} \leq 5.5V$, $1.2 \mu s$ for $2.7V \leq AV_{cc} < 4.5V$)
- If the sampling time cannot be sufficient, connect a capacitor of about $0.1 \mu F$ to the analog input pin.
- A big external driving impedance also adversely affects the A/D conversion precision due to the pin input leakage current IIL (static current before the sampling switch) or the analog input leakage current $IAIN$ (total leakage current of pin input and comparator during sampling). The effect of the pin input leakage current IIL cannot be compensated by an external capacitor.
- The accuracy gets worse as $|AVRH - AVL|$ becomes smaller.

- Definition of 10-bit A/D Converter Terms

- Resolution : Analog variation that is recognized by an A/D converter.
- Linearity error : Deviation of the line between the zero-transition point (0b000000000000←→0b0000000001) and the full-scale transition point (0b1111111110←→0b1111111111) from the actual conversion characteristics.
- Differential linearity error : Deviation from the ideal value of the input voltage that is required to change the output code by 1 LSB.
- Total error : Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error, and linearity error.

$$1\text{LSB}' (\text{Ideal value}) = \frac{\text{AVRH} - \text{AVRL}}{1024} [\text{V}]$$

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1\text{LSB}' \times (N - 1) + 0.5\text{LSB}'\}}{1\text{LSB}'} [\text{V}]$$

N : A/D converter digital output value.

V_{NT} : Voltage at which the digital output changes from $0x(N + 1)$ to $0xN$.

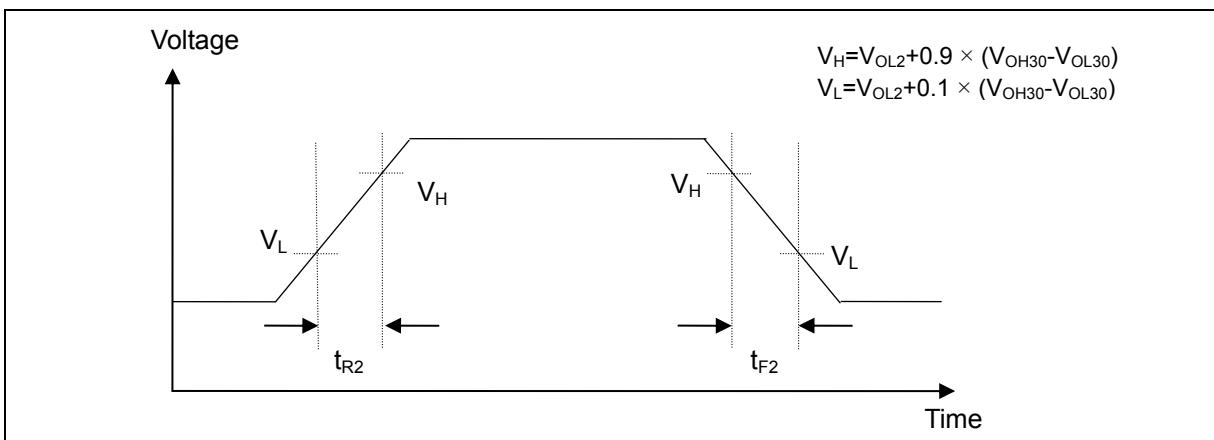

V_{OT}' (Ideal value) = $\text{AVRL} + 0.5\text{LSB}'[\text{V}]$

V_{FST}' (Ideal value) = $\text{AVRH} - 1.5\text{LSB}'[\text{V}]$

● High current output slew rate

($V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $DV_{CC} = 4.5V$ to $5.5V$, $V_{SS} = AV_{SS} = DV_{SS} = 0V$, $T_A = -40^\circ C$ to $+105^\circ C$)

Parameter	Symbol	Conditions	Value			Unit	Remarks
			Min	Typ	Max		
Detected voltage	VDL0	CILCR:LVL = 0000 _B	2.70	2.90	3.10	V	
	VDL1	CILCR:LVL = 0001 _B	2.79	3.00	3.21	V	
	VDL2	CILCR:LVL = 0010 _B	2.98	3.20	3.42	V	
	VDL3	CILCR:LVL = 0011 _B	3.26	3.50	3.74	V	
	VDL4	CILCR:LVL = 0100 _B	3.45	3.70	3.95	V	
	VDL5	CILCR:LVL = 0111 _B	3.73	4.00	4.27	V	
	VDL6	CILCR:LVL = 1001 _B	3.91	4.20	4.49	V	
Change ration of power supply voltage	dV/dt	-	-0.004	-	-	V/μs	Detected voltage (VDL) must be within standards.

● Flash Memory Write/Erase Characteristics

(V_{CC} = AV_{CC} = DV_{CC} = 2.7V to 5.5V, V_{SS} = AV_{SS} = DV_{SS} = 0V, T_A = - 40°C to + 105°C)

Parameter	Value			Unit	Remarks
	Min	Typ	Max		
Sector erase time	Large Sector	-	0.6	3.1	s
	Small Sector		0.3	1.6	s
Half word (16 bit) write time		-	25	400	μs
Chip erase time		-	2.7	14.2	s

Erase / write cycles and data hold time (targeted value)

Erase / write cycles (cycle)	Data hold time (year)
1,000	20 *
10,000	10 *
100,000	5 *

*: This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at + 85°C).

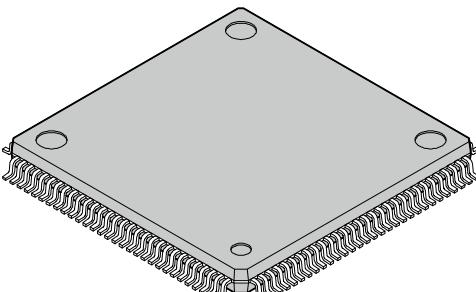

■ ORDERING INFORMATION

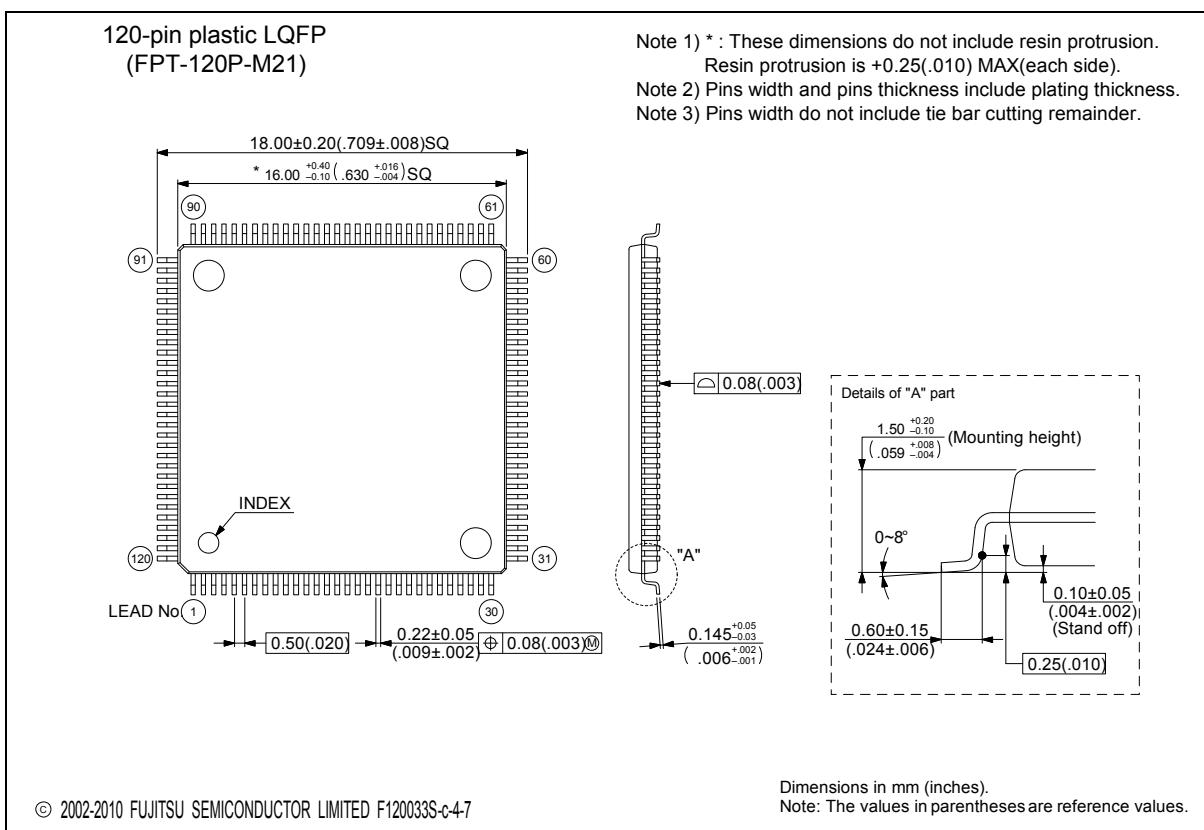

Part number	Flash memory	Package
MB96F6A6RAPMC-GSE1*	Flash A (288.5KB)	120-pin plastic LQFP (FPT-120P-M21)
MB96F6A6RAPMC-GSE2*		

*: These devices are under development and specification is preliminary.

These products under development may change its specification without notice.

■ PACKAGE DIMENSION

 120-pin plastic LQFP (FPT-120P-M21)	Lead pitch 0.50 mm Package width × package length 16.0 × 16.0 mm Lead shape Gullwing Sealing method Plastic mold Mounting height 1.70 mm MAX Weight 0.88 g Code (Reference) P-LFQFP120-16×16-0.50
---	--

Specifications are subject to change without notice. For further information please contact each office.

All Rights Reserved.

The contents of this document are subject to change without notice.

Customers are advised to consult with sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of FUJITSU SEMICONDUCTOR device; FUJITSU SEMICONDUCTOR does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information.

FUJITSU SEMICONDUCTOR assumes no liability for any damages whatsoever arising out of the use of the information. Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of FUJITSU SEMICONDUCTOR or any third party or does FUJITSU SEMICONDUCTOR warrant non-infringement of any third-party's intellectual property right or other right by using such information. FUJITSU SEMICONDUCTOR assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that FUJITSU SEMICONDUCTOR will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

Exportation/release of any products described in this document may require necessary procedures in accordance with the regulations of the Foreign Exchange and Foreign Trade Control Law of Japan and/or US export control laws.

The company names and brand names herein are the trademarks or registered trademarks of their respective owners.
