

MC10E1651

5V, -5V Dual ECL Output Comparator with Latch

The MC10E1651 is fabricated using ON Semiconductor's advanced MOSAIC III process. The MC10E1651 incorporates a fixed level of input hysteresis as well as output compatibility with 10 KH logic devices. In addition, a latch is available allowing a sample and hold function to be performed. The device is available in a 20-pin surface mount package.

The latch enable (\overline{LEN}_a and \overline{LEN}_b) input pins operate from standard ECL 10 KH logic levels. When the latch enable is at a logic high level, the MC10E1651 acts as a comparator; hence, Q will be at a logic high level if $V_1 > V_2$ (V_1 is more positive than V_2). \overline{Q} is the complement of Q. When the latch enable input goes to a low logic level, the outputs are latched in their present state providing the latch enable setup and hold time constraints are met.

Features

- Typical 3.0 dB Bandwidth > 1.0 GHz
- Typical V to Q Propagation Delay of 775 ps
- Typical Output Rise/Fall of 350 ps
- Common Mode Range -2.0 V to +3.0 V
- Individual Latch Enables
- Differential Outputs
- 28 mV Input Hysteresis
- Operating Mode: $V_{CC} = 5.0$ V, $V_{EE} = -5.2$ V, GND = 0 V
- No Internal Input Pulldown Resistors
- ESD Protection: > 2 kV Human Body Model, > 100 V Machine Model
- Meets or Exceeds JEDEC Spec EIA/JESD78 IC Latchup Test
- Moisture Sensitivity Level 3
For Additional Information, see Application Note AND8003/D
- Flammability Rating: UL 94 V-0 @ 0.125 in, Oxygen Index: 28 to 34
- Transistor Count = 85 devices
- These are Pb-Free Devices*

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

Figure 2. Logic Diagram

Table 1. PIN DESCRIPTION

PIN	FUNCTION
Qa, \overline{Qa}	ECL Differential Outputs (a)
Qb, \overline{Qb}	ECL Differential Outputs (b)
\overline{LENa} , \overline{LENb}	ECL Latch Enable
V1a, V1b	Input Comparator 1
V2a, V2b	Input Comparator 2
V_{CC}	Positive Supply
V_{EE}	Negative Supply
NC	No Connect
GND	Ground

Table 2. FUNCTION TABLE

\overline{LEN}	V1, V2	Function
H	$V1 > V2$	H
H	$V1 < V2$	L
L	X	Latched

Table 3. MAXIMUM RATINGS

Symbol	Parameter	Condition 1	Condition 2	Rating	Unit
V _{SUP}	Total Supply Voltage	V _{EE} + V _{CC}		12.0	V
V _{PP}	Differential Input Voltage	V ₁ – V ₂		3.7	V
V _I	Input Voltage			V _{EE} ≤ V _I ≤ V _{CC}	V
I _{out}	Output Current	Continuous Surge		50 100	mA mA
T _A	Operating Temperature Range			0 to +85	°C
T _{stg}	Storage Temperature Range			–65 to +150	°C
θ _{JA}	Thermal Resistance (Junction–to–Ambient)	0 lfpm 500 lfpm	28 PLCC 28 PLCC	63.5 43.5	°C/W °C/W
θ _{JC}	Thermal Resistance (Junction–to–Case)	Standard Board	28 PLCC	22 to 26	°C/W
V _{EE}	Operating Range	GND = 0 V		–4.2 to –5.7	V
T _{sol}	Wave Solder Pb–Free	≤ 3 sec @ 260°C		265	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Table 4. DC CHARACTERISTICS V_{CC} = +5.0 V ±5%; V_{EE} = –5.2 V ±5%, GND = 0 V (Note 1)

Symbol	Characteristic	0°C			25°C			85°C			Unit
		Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	
V _{OH}	Output HIGH Voltage (Note 1)	–1020		–840	–980		–810	–920		–735	mV

V _{IL}	Input LOW Voltage (<u>LEN</u>) (Note 1)	–1.95		–1.48	–1.95		–1.48	–1.95		–1.45	mV
V _{IH}	Input HIGH Voltage (<u>LEN</u>) (Note 1)	–1.17		–0.84	–1.13		–0.81	–1.07		–0.735	mV
I _I I _{IH}	Input Current (V ₁ , V ₂) Input HIGH Current (<u>LEN</u>)			65 150			65 150			65 150	μA
I _{CC} I _{EE}	Positive Supply Current Negative Supply Current			50 –55			50 –55			50 –55	mA
V _{CMR}	Common Mode Range (Note 2)	–2.0		3.0	–2.0		3.0	–2.0		3.0	V
Hys	Hysteresis		27			27			30		mV
V _{skew}	Hysteresis Skew (Note 3)		–1.0			–1.0			0		mV
C _{in}	Input Capacitance PLCC			2			2			2	pF

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

1. Input V_{IL} and V_{IH} parameters vary 1:1 with V_{CC}. Output V_{OH} and V_{OL} parameters vary 1:1 with GND.
2. V_{CMR} Min varies 1:1 with V_{EE}; Max varies 1:1 with V_{CC}.
3. Hysteresis skew (V_{skew}) is provided to indicate the offset of the hysteresis window. For example, at 25°C the nominal hysteresis value is 27 mV and the V_{skew} value indicates that the hysteresis was skewed from the reference level by 1mV in the negative direction. Hence the hysteresis window ranged from 14 mV below the reference level to 13 mV above the reference level. All hysteresis measurements were determined using a reference voltage of 0 mV.

MC10E1651

Table 5. AC CHARACTERISTICS $V_{CC} = +5.0\text{ V} \pm 5\%$; $V_{EE} = -5.2\text{ V} \pm 5\%$, $GND = 0\text{ V}$ (Note 4)

t_r t_f	Rise/Fall Times (20-80%)	225	325	475	225	325	475	250	375	500	ps

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- Input V_{IL} and V_{IH} parameters vary 1:1 with V_{CC} , output V_{OH} and V_{OL} parameters vary 1:1 with GND .
- t_{skew} is the propagation delay skew between comparator A and comparator B for a particular part under identical input conditions.
- Refer to figure 4 and note that the input is at 850mV ECL levels with the input threshold range between the 20% and 80% points. The delay is measured from the crosspoint of the input signal and the threshold value to the crosspoint of the Q and \overline{Q} output signals.
- The slew rate is 0.25 V/NS for input rising edges.
- The slew rate is 0.75 V/NS for input rising edges.
- Refer to Figure 5 and note that the input is at 2.5 V TTL levels with the input threshold range between the 20% and 80% points. The delay is measured from the crosspoint of the input signal and the threshold value to the crosspoint of the Q and \overline{Q} output signals.
- The slew rate is 0.3 V/NS for input rising edges.

APPLICATIONS INFORMATION

The timing diagram (Figure 3.) is presented to illustrate the MC10E1651's compare and latch features. When the signal on the $\overline{\text{LEN}}$ pin is at a logic high level, the device is operating in the "compare mode," and the signal on the input arrives at the output after a nominal propagation delay (t_{PHL} , t_{PLH}). The input signal must be asserted for a time, t_s , prior to the negative going transition on $\overline{\text{LEN}}$ and held for a time, t_h , after the $\overline{\text{LEN}}$ transition. After time t_h , the latch is operating in the "latch mode," thus transitions on the input do not appear at the output. The device continues to operate in the "latch mode" until the latch is asserted once again. Moreover, the $\overline{\text{LEN}}$ pulse must meet the minimum pulse width (t_{pw}) requirement to effect the correct input-output relationship. Note that the $\overline{\text{LEN}}$ waveform in Figure 3. shows the $\overline{\text{LEN}}$ signal swinging around a reference labeled $\text{V}_{\text{BB_INT}}$; this waveform emphasizes the requirement that $\overline{\text{LEN}}$ follow typical ECL 10KH logic levels because

$\text{V}_{\text{BB_INT}}$ is the internally generated reference level, hence is nominally at the ECL V_{BB} level.

Finally, V_{OD} is the input voltage overdrive and represents the voltage level beyond the threshold level (V_{THR}) to which the input is driven. As an example, if the threshold level is set on one of the comparator inputs as 80 mV and the input signal swing on the complementary input is from zero to 100 mV, the positive going overdrive would be 20 mV and the negative going overdrive would be 80 mV. The result of differing overdrive levels is that the devices have shorter propagation delays with greater overdrive because the threshold level is crossed sooner than the case of lower overdrive levels. Typically, semiconductor manufactures refer to the threshold voltage as the input offset voltage (VOS) since the threshold voltage is the sum of the externally supplied reference voltage and inherent device offset voltage.

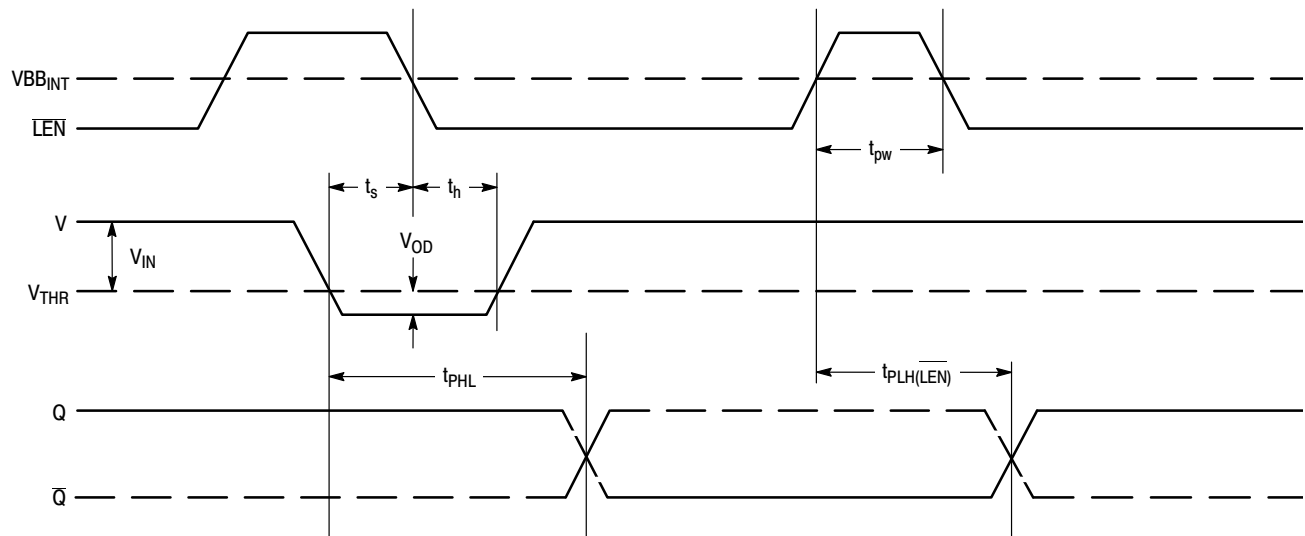

Figure 3. Input/Output Timing Diagram

DELAY DISPERSION

Under a constant set of input conditions comparators have a specified nominal propagation delay. However, since propagation delay is a function of input slew rate and input voltage overdrive the delay dispersion parameters, T_{DE} and T_{DT} , are provided to allow the user to adjust for these variables (where T_{DE} and T_{DT} apply to inputs with standard ECL and TTL levels, respectively).

Figure 4 and Figure 5 define a range of input conditions which incorporate varying input slew rates and input voltage overdrive. For input parameters that adhere to these constraints the propagation delay can be described as:

$$T_{NOM} \pm T_{DE} \text{ (or } T_{DT}\text{)}$$

where T_{NOM} is the nominal propagation delay. T_{NOM} accounts for nonuniformity introduced by temperature and voltage variability, whereas the delay dispersion parameter takes into consideration input slew rate and input voltage overdrive variability. Thus a modified propagation delay can be approximated to account for the effects of input conditions that differ from those under which the parts were tested. For example, an application may specify an ECL input with a slew rate of 0.25 V/NS, an overdrive of 17 mV and a temperature of 25°C, the delay dispersion parameter would be 100 ps. The modified propagation delay would be

$$775 \text{ ps} \pm 100 \text{ ps}$$

PACKAGE DIMENSIONS

20 LEAD PLLC CASE 775-02 ISSUE F

NOTES:

1. DIMENSIONS AND TOLERANCING PER ANSI Y14.5M, 1982.
2. DIMENSIONS IN INCHES.
3. DATUMS -L-, -M-, AND -N- DETERMINED WHERE TOP OF LEAD SHOULDER EXITS PLASTIC BODY AT MOLD PARTING LINE.
4. DIMENSION G1, TRUE POSITION TO BE MEASURED AT DATUM -T-, SEATING PLANE.
5. DIMENSIONS R AND U DO NOT INCLUDE MOLD FLASH. ALLOWABLE MOLD FLASH IS 0.010 (0.250) PER SIDE.
6. DIMENSIONS IN THE PACKAGE TOP MAY BE SMALLER THAN THE PACKAGE BOTTOM BY UP TO 0.012 (0.300). DIMENSIONS R AND U ARE DETERMINED AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY EXCLUSIVE OF MOLD FLASH, TIE BAR BURRS, GATE BURRS AND INTERLEAD FLASH, BUT INCLUDING ANY MISMATCH BETWEEN THE TOP AND BOTTOM OF THE PLASTIC BODY.
7. DIMENSION H DOES NOT INCLUDE DAMBAR PROTRUSION OR INTRUSION. THE DAMBAR PROTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE GREATER THAN 0.037 (0.940). THE DAMBAR INTRUSION(S) SHALL NOT CAUSE THE H DIMENSION TO BE SMALLER THAN 0.025 (0.635).
