Quad 2-Input Multiplexer/ Latch

The MC10H173 is a quad 2-input multiplexer with latch. This device is a functional/pinout duplication of the standard MECL 10K part, with 100% improvement in propagation delay and no increase in power supply current.

- Data Propagation Delay, 1.5 ns Typical
- Power Dissipation, 275 mW Typical
- Improved Noise Margin 150 mV (over operating voltage and temperature range)

 1. Each MECL 10H series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50-ohm resistor to -2.0 volts.

MC10H173

APPLICATION INFORMATION

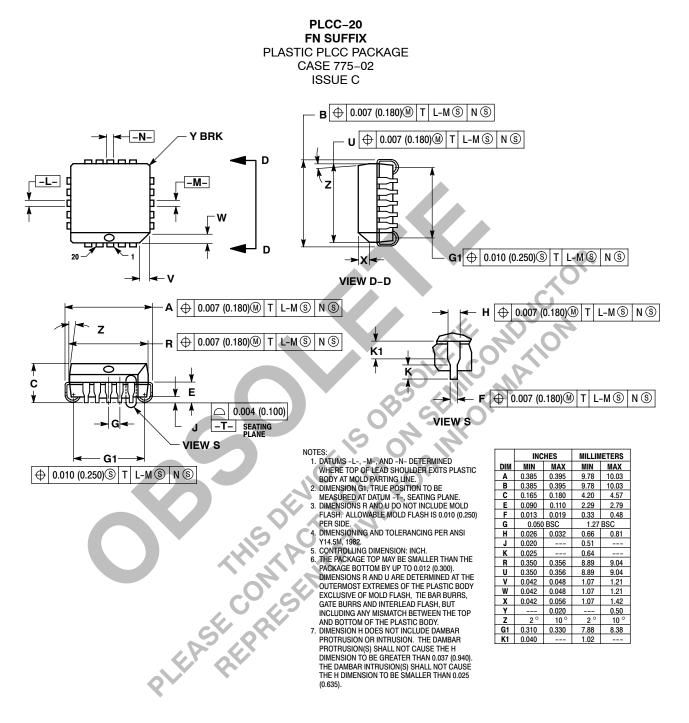

The MC10173 is a quad two-channel multiplexer with latch. It incorporates common clock and common data select inputs. The select input determines which data input is enabled. A high (H) level enables data inputs D00, D10, D20, and D30 and a low (L) level enables data inputs D01, D11, D21, D31. Any change on the data input

will be reflected at the outputs while the clock is low. The outputs are latched on the positive transition of the clock. While the clock is in the high state, a change in the information present at the data inputs will not affect the output information.
