1 General

1.1 For customers in the U.S.A.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense. You are cautioned that any changes or modifications not expressly approved in this manual could void your authority to operate this equipment. The shielded interface cable recommended in this manual must be used with this equipment in order to comply with the limits for a computing device pursuant to Subpart J of Part 15 of FCC Rules.

1.2 For customers in Canada

This apparatus complies with the Class A limits for radio noise emissions set out in Radio Interference Regulations.

1.3 Pour utilisateurs au Canada

Cet appareil est conforme aux normes Classe A pour bruits radioélectriques, spécifiées dans le Règlement sur le brouillage radioélectrique.

1.4 Life Support Applications

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Mikrotron customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Mikrotron for any damages resulting from such improper use or sale.

1.5 Declaration of conformity

Manufacturer:	Mikrotron GmbH	
Address:	Freisingerstr. 3 85386 Eching Deutschland	
Product:	camera camera camera camera	MC1302 MC1303 MC1310 MC1311

The dedicated products conform to the requirements of the Council Directives 89/336/EWG for the approximation of the laws of the Member States relating to electromagnetic consistency. The following standards were consulted for the conformity testing with regard to electromagnetic consistency.

EC regulation	Description
EN 61000-6-3	Electromagnetic compatibility
EN 61000-6-1	Immunity

Eching, June 06th. 2003

Mikrotron GmbH

Dipl.-Ing. Bernhard Mindermann President of Mikrotron

1.6 Warranty Note

Do not open the body of the camera. The warranty becomes void if the body is opened.

1.7 Remarks, Warnings

This document contains important remarks and warnings. See the corresponding symbols:

i	Important remark

Attention, Warning

2 Introduction

The CMOS high speed camera MC13xx is a high resolution camera with 1280•1024 pixel. Benefits of CMOS technology are high speed, random access to pixels with free programmability and low power.

The camera uses industry-standard C-Mount lenses. The sensor diagonal is $1,25^{\circ\circ}$ with square pixels measuring $12\mu m$.

Free programmability means that the user is free to define the region of interest by size and position and the speed of data output. The frame rate can be slected between 25 fps and several thousand fps depending on resolution and video datawidth.

With a resolution of 1280 x 1024 pixel, 500 fps (MC131x) can be output via the "full Camera Link® parameter sets are called: profiles and stored in non volatile memory.

2.1 Top level specifications

- high resolution: 1.280•1.024 pixel CMOS sensor with 1300 A/D converters
- up to 1.024 gray levels
- up to 100 full frames/s for MC1302/03 up to 500 full frames/s for MC1310/11
- arbitrary region of interest
- high sensitivity
- 12µm square pixels
- electronic "Freeze Frame" shutter
- low blooming
- programmable via serial link
- patented ImageBLITZ® image trigger (MC1310/11)
- asynchronous trigger
- download customer specific FPGA preprocessing firmware
- small, compact housing
- wide power supply range

2.2 Electronic "Freeze Frame" Shutter

Preceding exposure, the contents of all light sensitive elements is cleared. When exposure terminates, accumulated charge is transferred to an analog memory associated which each pixel. It stays there until it is read out (and discharged) by the A/D conversion cycle.

As all light sensitive elements are exposed at the same time, even fast moving objects are captured without geometric distortion.

2.3 Differences between the camera types

The CMOS cameras MC1302/10 are monochrome, the MC1303/11 are a color cameras equipped with a Bayer filter.

MC13xx is being delivered in four different versions, color / monochrome, with or without Full Camera Link® interface. As reference the phased-out MC1301 is also shown.

Features	Data width	Color/ Mono	Full Camera	Base Camera	Framerate@ 1280 x 1024	Image- BLITZ®	Housing depth
Туре	(bits)		Link®	Link®			mm
MC1301	8	М	-	+	100fps	+	55
MC1302	10	М	-	+	100fps	-	48
MC1303	10	С	-	+	100fps	-	48
MC1310	10	М	+	+	500fps	+	48
MC1311	10	C	+	+	500fps	+	48

Table 2.3-1

2.4 Using the camera

There are no serviceable parts inside the camera.. The camera may not be opened, otherwise guarantee is lost.

Use dry, soft lens-cleaning tissue for cleaning lenses and, if necessary, the sensors window.

3.1 Camera Link® Interface

Camera Link® is designed for digital cameras in machine vision applications. A "Full Camera Link®" interface can transfer up to 64 bits of data at a rate of >528 Mbytes/sec.

3.1.1 Serial interface

The communication via the serial interface is incorporated in the "Base Camera Link \mathbb{R} interface. A description of the connector pinning is in chapter <u>9.2</u>.

3.2 Power supply

The camera needs a DC supply voltage between 8 ... 35 V at a power consumption of 6,0 Watt max..

See also <u>Connector pinning</u>.

3.3 Status LED

A dual colour LED on the camera backplane shows the operating condition of the MC13xx.

LED orange... The MC13xx is configuring the internal FPGA. No other activity is possible.

LED green... The MC13xx is fully operational.

LED off... If LED is off, despite the camera is powered, the FPGA configuration data is reloaded via the serial interface and stored in internal EEPROM. No other activity is possible.

4 Getting started

Before starting to operate the camera, make sure that the following equipment is available:

- Camera MC13xx
- C-Mount Lens
- Mikrotron Support CD
- Image processing system, e.g.: PC, frame grabber and Software

The frame grabber must have a Base- or Full Camera Link® Interface.

Additional items:

- 1 or 2 standard Camera Link® cables
- 1 Power supply 12VDC, 0.5A min
- 1 power cable

To specify cables see chapter <u>Connector pinning</u>.

4.1 First steps

- 1. Switch off the image processing system
- 2. Connect Camera Link® cable between camera and frame grabber.
- 3. Connect power cable.
- 4. Unscrew dust protection cover, screw in lens.
- 5. Switch on the image processing system and camera power supply

5 Initial setup

The MC13xx is delivered with initial parameters and therefore does not need to be configured via the serial link.

5.1 Serial number and firmware revision

Serial number and firmware revision is provided in MC13xx non volatile memory. Use :v command (<u>Read serial number and firmware revision</u>) to read serial number and firmware revision. The serial number is also marked on the type plate of the camera.

5.2 PowerUpProfile

The PowerUpProfile is the contents of all camera registers to be loaded from non-volatile memory after power up.

5.3 Camera Profile

The actual set of parameters is called Camera Profile. All changes of parameters by the serial link is reflected in the Camera Profile. On command the Camera Profile is saved to 8 user profiles or one PowerUpProfile. It is loaded from 8 user profiles or 8 factory profiles or the PowerUpProfile. The camera profile is volatile and must be stored to the PowerUpProfile to be reactivated on next poer up.

5.4 Factory profile

The factory profile can be read but not written by the user.

5.5 User profiles

The user can store up to eight PowerUpProfiles in non volatile memory. All load or write commands exchange data between the PowerUpProfile and one of the four user profiles.

Profil-Nr.	fil-Nr. Video data resolution		Image
	width	/ Pixel	frequency
			/fps
0	2x8	100 x 100	4.852
1	2x8	240 x 240	1.011
2	2x8	640 x 480	202
3	2x8	1280 x 1024	47
4	2x10	640 x 480	150
5	2x10	1280 x 1024	33
6	8x8	1280 x 1024	120
7	8x8	640 x 480	954

Table 5-1

6 Configuration

The MC13xx has 15 FPGA registers, $r1..rf_h$, each 10 bit wide, eight D/A registers, a1..a8, 8-bit wide, and one clock select register, 4 bit wide. The contents of all the above registers is called a profile. There is space in non volatile memory for 17 profiles: one PowerUpProfile, 8 user profiles and 8 factory profiles.

Any change of a specific register through the serial interface is immediately processed and written to the volatile part of the memory and gets lost when power goes down. A <u>command</u> must be used to store the actual setting in non volatile memory. After power-up the PowerUpProfile is loaded from the non-volatile to the volatile part of the memory.

A load or write command exchanges data between the PowerUpProfile and one of the eight user profiles. The eight factory profiles can be read but not be written by any command. All values are given in hexadecimal notation, e.g.: 0xff or 0ffh = 255.

6.1 Commands

ASCII strings are used to change camera parameters. All commands start with a colon, followed by one selection character and a value in hexadecimal notation with two or three ASCII characters.

After a command has been recognized, processing is immediate, for all commands but the save type commands (:px). These need a EEPROM write time of app 1ms. An answer is provided with read type commans (:v, :w, :W) or, if the command "command acknowledge flag" is set, after processing of each command an ACK or NAK character. Processing of wrong command is stopped immediately on recognizing the error. A new command must start with a colon.

6.1.1 Table of commands

Syntax	Range	Answer	Description
:a <n><xx></xx></n>	<n> = 18</n>		Set one of eight analog voltages for the sensor
	$ = 0ff_{h}$		
:A <n></n>	<n> =</n>		En- or disable a command acknowledge or not
	"y", "Y", "n", "N		acknowledge (ACK or NAK)
:b <n></n>	<n> = 04</n>		Select baud rate:
			0=9600 Bd (default setting), 1=19.2 kBd, 2=38.4 kBd, 3=56.8 kBd, 4=115.2 kBd,
			PESET and now Initialization of the camora now
.0			load of Powerl InProfile Duration: some seconds
·e			Transmit & save a new EPGA configuration
.c ·f <n></n>	<n> = 0 7</n>		Reload one of eight factory defined and cali-
.1 5112	0		brated profiles to PowerUpProfile.
:q <n></n>	<n> = 07</n>		Reload one of eight user profiles to
0			PowerUpProfile
:p <n></n>	<n> = 07</n>		Save PowerUpProfile to one of eight user pro-
			files, allow app. 1ms save time.
:r <n></n>	<n> = 1f_h</n>		Write a FPGA - register
:s <n></n>	<n> = 0f_h</n>		Select sensor and pixel clock from a table with
			16 entries.
:S	6 Byte Code		Program sensor and pixel clock directly.
:t <n><m></m></n>	<n> = 007f_h</n>		Short setting of X- position in units of 10 pixel
	<m> = 00ff_h</m>		and Y-position in units of 4 lines.
:x <xxyy></xxyy>	$ = 07f_{h}$		Short setting of horizontal image size and posi-
	<yy> =180</yy>		tion (xx = horizontal position,
	(nex)		yy = nonzontal width (unit: 10 pixel))
:y <xxxyyy< td=""><td><xxx>=03Πh</xxx></td><td></td><td>Short setting of image size and position in Y –</td></xxxyyy<>	<xxx>=03Πh</xxx>		Short setting of image size and position in Y –
-	<yyy>=1311_h</yyy>		width (unit: 1 lino)
		#12345-	Read serial number (#) microcontroller - version
		V1 10-	$(V_{\rm c})$ and EPGA - version (E)
		F1.29	
:w		camera	Read actual PowerUpProfile, data output in hex
		profile: 44	
		bytes in	
		hex	
:W		Camera	Read actual PowerUpProfile, data output in
		profile: 44	ASCII
		bytes in	
		ASCII	

6.2 Read serial number and firmware revision

The serial number and the firmware revision can be read with the :v command.

6.3 Profile processing

All camera settings are loaded or stored as complete data blocks (= Profiles). There are 17 profiles, the Camera profile, the PowerUpProfile, eight factory profiles and eight user profiles.

6.3.1 Read Camera profile

The response to the read Camera profile command :w is a hex string of the contents of all actual camera registers.

```
Command:
                     :w
Response(e.g.): 6d774ac800006a1c61e88c41898c0003ff3ff
       all values hex, e.g.: 70_{\text{HEX}} = 112_{\text{DEC}}
Sequence of transmitted data bytes:
A1 A2 A3 A4 A5 A6 A7 A8 Sa1 Sa2 Sa3 Sb1 Sb2 Sb3 R1h R11 ... R15h R15l 🗸
              A1...A8
                             image level control (FPN, contrast...)
              Sa1 Sa2 Sa3
                             3 Byte synthesizer code of pixel clock
              Sb1 Sb2 Sb3
                             3 synthesizer code of sensor clock
                             (see chapter 6.7.1)
              R1...R15
                             image control (image position, size, sync....)
              R1h ...
                            high Byte R1
                            low Byte R1
              R11 ...
```

CR+LF (0dh + 0ah)

6.3.2 Write user profile

₊ ...

The PowerUpProfile is transferred to one of the eight user profiles.

Command: :p<n> < n> = 0 ... 7,c

Issue this command only, if the PowerUpProfile was successfully tested.

6.3.3 Load user profile

Load one of eight user profiles to the PowerUpProfile.

Command: :g < n > = 0 ... 7, c

6.3.4 Load factory profile

The eight factory profiles can be read but not changed by the user.

Command: :: f < n > = 0 ... 7

6.4 Video data width, Base/ Full Camera Link®

MC13xx can output video data with 2 x 8-Bit or 2 x 10-Bit via the "Base Camera Link" interface, or 8 x 8-Bit or 10 x 8-Bit data via the "Full Camera Link" interface. Use register 7 Bits 7/5 to select.

Video data width	:r7[7]	:r7[5]		
2 x 8	0	0		
2 x 10	0	1		
8 x 8	1	0		
10 x 8	1	1		
Table 6.4-1				

The 10 x 8 - Bit data width lowers the clock speed for a given bandwidth, and needs a compatible frame grabber. The assignment of the 10 taps to the Camera Link® ports is described in chapter: 10*8-Bit Assignment.

There are no predefined profiles for 10 x 8 Bits stored in the MC1310/11. Any predefined 8 x 8-Bit profile can be used as starting point. Then change :r7 [7,5] to 1 and set Pixel Clock speed as described in: <u>Frequencies for video data width 10*8 - Bit</u>. This profile can then be stored as User Profile.

MC1302/03 Setting of r7[7] is ignored by the camera. MC1310/11: After a change of r7[7], change the selected frequency. See: <u>Table selection of clock frequen-</u> cies.

6.5 Image quality

There are three D/A converter to influence image quality: FPN, Gain, and Black up. FPN, Gain and especially Black might be adjusted if sensor clock changes. All three parameters are stored in non-volatile memory as part of the selected profile.

6.5.1 FPN

The Fixed Pattern Noise setting reduces the fixed pattern noise that is typical to CMOS sensors. This level might be changed if the sensor clock frequency is changed. For adjustment set the lens out of focus and to a medium grey level. Lower FPN until a heavy pattern appears. Then raise by a few points.

Command: $a1 < x_1 x_0 > < x_1 x_0 > :$ Range, typ. 55h ... 80h

Response: none

6.5.2 Gain

This is the threshold for the A/D converters. Its standard value is 66h for app. 1V. One step is app. 10mV. To increase the gain the value of a2 must be lowered.

Command: $a2 < x_1 x_0 >$ $< x_1 x_0 > :$ Range, typ. 30h ... 80h

6.5.3 Black Level

Change Black Level if sensor clock changes. Increase this parameter until grey values in no light condition (closed lens) are close to zero.

$:a5 < x_1 x_0 >$	$\langle x_l x_0 \rangle$: Range,
	typ. 00hffh
	$:a5 < x_1 x_0 >$

Response: none

6.6 Image size and position

Image size and position within the sensor is defined by four parameters:

Bit(s)	Description
r1[90]	Number of first line, 03FD _h
r3[90]	Number of lines, 03FF _h
r4[60]	Address/10 of the first pixel
r5[60]	Address/10 of the last pixel
	T_{-1}

Table 6.6-1

6.6.1 Address of the first line

Register r1 defines the first line to be displayed.

Command	: $r1 < x_2 x_1 x_0 >$
	$< x_2 x_1 x_0 > \dots$ Range 000h3fdh
Response:	none
Example:	:r1100
_	100h = image starts at line 257
6	If dual column binning is activated, r1 is doubled

6.6.2 Number of lines

Register r3 defines the number of lines to output.

within the camera logic.

Command: $:r3 < x_2 x_1 x_0 >$

 $< x_2 x_1 x_0 > \dots$ Range 000 h ...3ffh

Configuration

Response: none Example: :r3200 200h = display 513 lines

The sum of r1 and r3 must be $\leq 0x3ff/1023$ or 0x1ff/511 if dual column binning is activated!

6.6.3 Address of the first pixel of a line

Register r4 defines the leftmost pixel. The value is the pixel address divided by ten.

Command: $:\mathbf{r4} < \mathbf{x}_2 \mathbf{x}_1 \mathbf{x}_0 >
 < x_2 \mathbf{x}_1 \mathbf{x}_0 > \dots$ Range 000h ...7fh Response: none

Calculation of the value of r4: Value of r4 = Pixel-Nr./10

6.6.4 Address of the last pixel of a line

Register r4 defines the rightmost pixel. The value is the pixeladress divided by ten.

Command: $:r5 < x_2 x_1 x_0 > < < x_2 x_1 x_0 > ...$ Range 000h ...07fh Response: none

Calculation of the value of r5: Value of r5 = Pixel-Nr./10

The difference r5 - r4 must be in the range: $0 \le r5 - r4 \le 7 fh$.

6.6.5 Tracking

For rapid window movement even at slow baud rates a short command is provided..

command:

:t<n>,<m> <m> = X-position in pixel/10, range 00h ...07fh <n> = Y-position in lines / 4, range 00h ...0ffh

Response: none

6.7 Clock selection

The MC13xx is equipped with a 2-channel programmable clock synthesizer. One channel controls clock frequency of the sensor (sensorclock, F_{sens}), the other controls the frequency of the pixel clock (pixel-clock, F_{pix}). These independent clocks allow an always optimal ratio depending on the product of (image size \bullet image frequency) and the data rate on the output.

Example:

The MC13xx is connected to a frame grabber with a maximum data rate of 66MBytes/s via the,,Base Camera Link®" interface using

2 x 8 bit video data.. A pixel clock of 33 MHz has to be selected.

As the sensor outputs 10 pixel per clock a sensor clock of 6.6MHz could be chosen. Because the sensor can run up to a clock frequency of 66 MHz only 1/10 of the sensors possible speed would be used. To make use of the maximum sensor clock and maintaining the maximum data rate on the output, just 120 (1280/10 rounded to steps of 10) from the possible 1280 pixel per line can be selected.

Therefore the ratio of F_{sens} and F_{pix} depends on the selected line length:

 $F_{sens} \leq (F_{pix} \bullet 1280) / (5 * line length)$

or if 100 pixel line length is chosen: $F_{sens} = (33 \cdot 1280) / (5 \cdot 100) = 70,4 \text{ MHz}$

As this exceeds the maximum sensor clock frequency, F_{sens} is chosen as 66 MHz and F_{pix} as 33 MHz.

6.7.1 Arbitrary selection of sensor and pixel clock

Sensor and pixel clock can be set to any value, the product of: (sensor clock • line length/1280) must always be smaller (about 10%) than the qoutient: (pixel clock / video data width, e.g.: 2, or 8).

If <u>video data width</u> of 10×8 -Bit is selected, sensor clock = pixel clock.

command $:S < x_0 >$

 $< x_0 > \dots$ 6 characters, as described in chapter <u>Frequency selection</u>

6.7.2 Table selection of clock frequencies

To simplify clock selection when using video data width of 2, clocks can be selected from a table with 15 entries, each entry being optimized for four regions of line length. (see table in 9.3).

Example: 240 < line length <= 640 Pixel, clock selection s9 pixelclock: 27,5 MHz sensorclock: 11,2 MHz resulting max. datarate on the 16-Bit output: 27,5 MHz/s * 2 Byte = 55,0 Mbyte/sec. This is valid for a line length between 250 and 640 pixel.

command :s $< x_0 >$

<x₀> ... range 0 ... f (hex)

and

Before selecting the data rate of the camera check the maximum data rate of the frame grabber, which must be higher (or at least the same).

6.8 Exposure control

Exposure control is selected with register r6[7..4] and register r2[9..0].

Bit(s)	Description
r6[74]	Type of exposure
r2[90]	Exposure time

table 6-1

6.8.1 Type of exposure

The MC13xx can expose the images synchronous or asynchronous.

Synchronous means that the next image is exposed, while the current image is output.

With asynchronous exposure, an external signal starts expose, and the exposed image is output after the exposure ends. Exposure time is defined either by an internal timer or by the width of the external EXP – signal. Bits 7..4 of registers r6 define exposure type: (:r6[7..4]).

r6 Bits	7	6	5	4
Camera stop	Х	Х	Х	0
Synchronous	0	0	0	1
Synchronous, with electr. shutter	0	0	1	1
Asynchronous, pulse width	1	0	1	1
Asynchronous, timer	1	1	1	1

Table 6.8-1

6.8.2 Frame rate with synchronous exposure

The frame rate with synchronous exposure is direct proportional to the selected number of lines.

The time for one line is::

 $T_{zz} = 1/F_{sens} \bullet 136 [sec]$ $T_{zz} \dots time/line$ $F_{sens} \dots Sensorclock$

Frame rate: = 1 / (time/line • number of lines+1) or: = $F_{sens}/(136 • (r3[9..0]+2))$

Dependencies between image size and frame rate for typical clock frequencies are given in the following table:

image size	100x100	240x240	640x480	1280x1024
Senso rclock (MHz)	66	33	13,2	6,6
Time/line [µs]	2,06	4,12	10,3	20,6
Frames/s	4.852	1.011	202	47
	T 11 (0	2		

Table 6.8-2

6.8.3 Synchronous operation without shutter

Without electronic shutter the exposure time is 1 / frame rate.

6.8.4 Synchronous operation with shutter

In the sensor is implemented a freeze frame shutter, which allows to reduce the exposure time in steps of one line. The minimum value of the exposure time is the duration of 2 line periods, which is determined by the value of r2 (min. 001h).

Command: $:r2 < x_2 x_1 x_0 >$ $< x_2 x_1 x_0 > ...$ Range 001h ...3ffh Response: none Exposure time T_B: $Tt_B = r2 \bullet T_{ZZ} - T_{ZZ} / 2$ $T_B ... exposure time in s$ <math>r2 ... value of register 2 $T_{ZZ} ... time/line$ $T_{zz} = 1/F_{sens} * 136$ [s] $Tt_{zz} ... Time/line$

F_{sens}... sensor clock

Typical exposure times:

Sensor clock	Zeit/Zeile	r2	r2
frequency (MHz)	(µsec)	bei 1/5.000 s	bei 1/10.000 s
66	2,06	97	49
33	4,12	49	24
13,2	10,3	19	10
6,6	20,6	10	5

```
Table 6.8-3
```

6.8.5 Frame rate with asynchronous exposure

The frame rate with asynchronous exposure = <u>Frame rate with synchronous exposure</u> – (1 / exposure time).

6.8.6 Asynchronous exposure, shutter control by pulse width

This operating mode is selected with register 6: :r6[7..4] = 0xb

Exposure time depends on the width of the external EXP – signal.

6.8.7 Asynchronous exposure, shutter control by timer

This operating mode is selected with register 6: :r6[7..4] = 0xf

The asynchronous exposure time is dependent on :r2[9..0]. The exposure timer counts as many lines as are defined in register :r2[9..0].

Exposure time: $T_{B} = 1/F_{sens} * 136 \bullet (1+r2[9..0]) \quad [Sec]$ $T_{B} \dots \text{ exposure time}$ $F_{sens..} \text{ sensor clock}$ example: sensor clock = 66MHz value of r2[9..0] = 6 $T_{B} = 136 \bullet 6 \bullet 15 \text{ ns} = 12,2 \text{ }\mu\text{s}$

6.9 Firmware

6.9.1 Update Firmware

MC13xx's logic is integrated into a FPGA (Field Programmable Gate Array), which's configuration is stored in an EEPROM. Upon power up or a command the FPGA is loaded with this configuration. Configuration data can be downloaded via the serial interface of Camera Link®. Mikrotron may provide configuration files (*.ibf) on request.

After download of configuration data, this data is permanently stored in EEPROM and the FPGA is configured with the new data. Besides a power cycle, the **:c** command can be used to reconfigure the FPGA with the internally stored configuration data.

Download of *.ibf file via serial link with 9600Bd takes app. 1.5 min. There should be no loss of power or communication during this time!

6.9.2 Reset and configuration of the internal FPGA

The command :c executes a reset in the camera. The FPGA will be reconfigured and all internal registers reloaded with the last saved PowerUpProfile. The FPGA is also configured after each power up.

Command: :c Response: none

6.10 Horizontal pixelbinning

Pixelbinning adds the gray values of two adjacent pixels and outputs it as one pixel with double sensitivity. In X-direction only 512 pixels are needed to cover the sensors full size. To retain aspect ratio, every second line is omitted or <u>vertical pixelbinning</u> can be activated.

Command: :r7010 Response: none

When selecting lines with \mathbf{r}_1 , or \mathbf{r}_3 the contents of r1 is doubled in camera logic. To address a specific line on the sensor, the value of r1 has to be divided by two and r3 must not exceed 1ffh.

Example: To output 256 lines from line 128, set r1 = 63 and r3 = 255 (=0xff).

6.11 Vertical pixelbinning

Vertical pixelbinning adds the gray values of two superimposed pixel of a column. This doubles sensitivity and vertical field of view. To retain aspect ratio, in addition <u>horizontal binning</u> must be activated. To activate, set bit 2 in register 6.

Command example: :r6034 Response: none

6.12 Digital shading correction

For the best possible image quality even at the sensors clock limit, and non uniform lighting, the MC13xx can store gray levels along one line and subtract these from all lines of an image.

To setup shading correction set: :r6[1] = 0.

Then a uniform object should be used together with the desired lighting, exposure mode and time and lens. The lens should be closed so that the remaining light level along the center line of the image is as close to zero as possible, but not reaching zero.

Then set :r6[1] = 1.

The gray levels along the center line of the image are saved in volatile memory and then subtracted form all lines of the following images, as long as this bit remains set.

6.13 Digital gain

Digital gain selection is only possible with <u>video data width</u> 2×8 -Bit or 8×8 -Bit. Out of the 10-bits sensor data either the most significant 8 bits (gain 1), or bits 8..1 (gain 2), or the least significant 8 bits (gain 4) are selected.

Command: r700x x = 0: gain 1 x = 4: gain 2 x = 8: gain 4

6.14 External clock input

MC13xx frequency synthesizer can use the Camera Link® used to synchronize several MC13xx to one master clock.

To activate set Bit 9 of register 7.

Command example: :r7200 response: none

If the external reference clock is different from 3.6864 MHz, the codes for the clock synthesizer have to be recalculated.

6.15 Polarity of EXP-signal

The polarity of the EXP-signal can be positive- or negative active. Use :r7[8] to select.

Negativ = :r7[8] = 1

Positiv = :r7[8] = 0

Command example: :r7100 Response: none

6.16 Test image

For testing of camera logic and video data transmission, sensor data can be replaced by an internal gray scale pattern with pixel values of 0..127. Use digital gain command to see pixel values of 0..255.

Command example: **:r7040** r7[6] Response: none

6.17 Image counter

If a sequence of frames is to be recorded for long time at a high frame rate, it can be useful to mark the images for later identification or check for completeness.

MC13xx has a 16-Bit image counter whose count can replace the first two pixel of every image. The image counter is cleared with every low to high transition of r7[1], the camera enable bit. It is incremented by every new image.

Command example: **:r7002** r7[1] Response: none

6.18 ImageBLITZ® shutter release, MC1310/11 only

The ImageBLITZ® shutter release is only implemented in MC1310/11, not in MC1302/03.

ImageBLITZ can replace an external signal (e.g.: a light barrier) to release the shutter. Like a light barrier, ImageBLITZ is used to capture fast moving objects on the exact same position on the image.

Contrary to the light barrier, ImageBLITZ uses the same information as condition to release the shutter as the then exposed image.

ImageBLITZ defines one specific line or a part of the 1024 lines as trigger window. This is true even if the selected image size is less 1024 lines or outside of the selected image area.

After activation of ImageBLITZ and after issuing the EXP signal as an enable signal, the MC131x hardware checks the gray values in the trigger window at a repetition rate that is defined by the exposure time selected with bits 3..0 of r6.

If a selectable number of pixels along that trigger window exceed or fall short of a selectable threshold, one single image is exposed and output.

To adjust ImageBLITZ®, the trigger line can be superimposed to the image. Within the selected line, 10 pixel are displayed as a dotted black- and white line as long as the selected threshold is not passed.

ImageBLITZ is configured with the registers r8..rC_h:

6.18.1 ImageBLITZ® processing

When ImageBLITZ® is activated with $:r7_h[0] = 1:$

- 1. Wait for an active edge on the EXP input.
- 2. The MC13xx exposes a line, that was chosen with :rC[9..0] and is called trigger line, for an exposure time defined by :r2[9..0]. It compares the intensity of a group of 10 pixel along the selected trigger line against an adjustable threshold (:rA_h[7..0], Range: 255..0).
- 3. The number of exceedings $(:rA_h[8] = 0)$ or fall backs $(:rA_h[8] = 1)$, are counted, and the result is compared to a second threshold $(:rB_h[6..0], Range: 127..0)$.
- 4. Each time this threshold is exceeded (release condition); an "inhibit counter" (:rD_h[9..0], Range 1..255) is loaded.
- 5. The inhibit counter" :rD_h[9..0] is counted down, each time the "release condition" was not reached. Once this "inhibit counter" has expired, a new image is exposed and output. After image is output, repeat at 1.

6.18.2 ImageBLITZ® programming

ImageBLITZ® is programmed by registers r8..rD_h and activated with r7[0].

6.18.2.1 Address of trigger line

The register rC_h determines the vertical position of the trigger line in the image.

command	$:rC_h < x_2 x_1 x_0 > < x_2 x_1 x_0 > \dots range 00h \dots 3ffh $
Response	e: none
Example	rc100 100h = 256
(i)	In pixelbinning mode the value of rC is internally doubled. The value must not be higher than 1ffh/511.

6.18.2.2 Leftmost pixel of the triggerline

The value of register r8 / 10 is the number of the leftmost pixel in the trigger line.

Command: $:r8 < x_2 x_1 x_0 >$ $< x_2 x_1 x_0 > \dots$ range 000h ...07fh Response: none Calculation of r8: Value of r8 = pixel number / 10

6.18.2.3 Rightmost pixel of the trigger line

The end of the trigger line is determined by the value of register r9.

Command:	$:r9 < x_2 x_1 x_0 >$
	$< x_2 x_1 x_0 > \dots$ range 000h7fh
Response:	none

Calculation of r9:

Value of r9 = pixel number / 10

6.18.2.4 Threshold level, mark trigger line

The threshold level is set by register rA_h . The pixel values along the trigger line are compared with this value.

Command:	$:\mathbf{rA}_{\mathbf{h}} < x_2 x_1 x_0 >$
	$\langle x_l x_0 \rangle$ range 0ffh
	$\langle x_2 \rangle = 0$: pixel gray level > threshold level,
	trigger line not visible
	1: pixel gray level < threshold level,
	trigger line not visible
	2: pixel gray level > threshold level,
	trigger line visible
	3: pixel gray level < threshold level,
	trigger line visible
Rasponsa.	none

Response: none

The trigger line is displayed as dashed, black and white line. One dash has a length of 10 pixel. The trigger line is only displayed in parts of the line where the pixel fulfill the trigger requirements. Under normal operation conditions the trigger line will be visible only in parts. The number of dashes may be counted and used for the setting of register rB_h .

6.18.2.5 Release condition

Register rB_h contains the release condition.

none

The release condition is determined by the number of pixels along the triggerline that fulfill the trigger requirements.

Command:	$rB_h < x_{9,\theta} >$
	$\langle x_{60} \rangle = 0$ 7fh, number of pixel that match the trigger requirements
	$< x_{87} = 0$: correction value 0 for the X - position of output window
	$< x_{87} = 1$: correction value 4 for the X - position of output window
	$< x_{87} = 2$: correction value 8 for the X - position of output window
	$< x_{87} = 3$: correction value 12 for the X - position of output window

Response:

6.18.2.6 Release Inhibit

The Release Inhibit function is defined with $:rD_h$. It tells ImageBLITZ how often sequentially the "release condition" must **not** be met, before an image is output.

Configuration

This feature allows to trigger an object only once on the dark- to bright edge of the scene. This avoids retriggering, once the trigger condition was met and the object is still visible within the triggerline after the image has been output.

Command:

: $\mathbf{rD}_{\mathbf{h}} < x_{7..0} >$ $< x_{7..0} > = 0$..ffh, number of fulfilled, sequentially trigger conditions

Response:

none

6.18.3 ImageBLITZ® registers

Register	Bit	Description	
r7	0	= 1: activate ImageBLITZ®	
r8	60	First pixel mod. 10	
r9	60	Last pixel mod. 10	
rA _h	70	Exposure threshold	
	8	1: bright object triggers	
		0: dark object triggers	
	9	1: make triggerline visible	
rB_h	60	Number of exceedings or fall backs, release con-	
		dition,	
	87	X – tracking correction	
	9	X – tracking enable.	
rC _h	90	Address of triggerline	
rD _h	70	exposure limitation, number of exposures without	
		exposure condition until an image is captured	
Table 6.18-1			

Registers r1..r7 are programmed according to image size and position and for <u>Asynchronous operation</u>, <u>timer</u>.

Register	Bit	Description
r1, r3r5		Image size and position
r2	90	Async operation, timer
r6	74	Ofh
		T 11 (10 2

Table 6.18-2

6.18.4 ImageBLITZ® setup

The MC13xx is configured for <u>asynchronous operation with timer</u>, registers r8, r9 and rC_h are loaded for the desired position of the trigger line. Register rB_h is loaded with 0, register rA_h with 201_h, so that the trigger line is visible.

If the image is zoomed down for display by an application program, every other line may be omitted and the trigger line may then disappear.

ImageBLITZ® is enabled with Register r7 Bit1=1.

Now position the trigger line with the registers r8, r9 and rC_h across the object that is used for the shutter release.

Clear Bit 8 in Register rA_h if a bright objects releases the shutter, set $rA_h[8]$ if dark objects release the shutter. While the trigger line is placed across the object, raise threshold with $rA_h[7..0]$ until as many dashes from the trigger line disappear as are loaded in Register rB_h [6..0]. This is called the release condition.

If it is expected that the release condition is met more than once for a single object, load rB_h [9..7] with a number of exposed lines that will not met the release condition before exposing one image.

7 MC13xx configuration tool

The MC13xx configuration tool must be installed on a Windows PC. (Win9x, WinNT, Win2K, WinXP) by means of the setup software. See also <u>www.mikrotron.de</u> to download the latest version.

This software provides an almost self explaining user interface to modify any camera parameter. The description of the parameters follows the marked chapters in this user manual.

To use this tool with the camera MC13xx the serial interface is integrated in the Camera Link® interface. You do not need any other additional cable.

8 Mechanical dimensions

8.1 Camera body

The camera body is with its dimensions of $63 \times 63 \times 41$ mm (without lens) very compact. To fasten the camera there are two mounting holes M4x7mm and one tripod connection on each side available.

8.1.1 Dimensioned drawing, side view of MC13xx

8.1.2 Dimensioned drawing, front view of MC13xx

8.1.3 Dimensioned drawing, rear view of MC13xx

8.2 Lens adjustment

8.2.1 Adjustable lens adapter

For fine adjustment of the focal length a lens adapter with an adjustment range of ± 1 mm is provided. Use the three screws nearby the sensor window to fasten the lens adapter after a proper adjustment together with the chosen lens.

8.2.2 Lens selection

Due to the size of the sensor use C-Mount lenses with the largest possible optical diameter or an adapter for lenses like F-Mount, especially for lenses with a focal length < 25mm.

9.4.3 10*8-Bit Assignment

The below table shows the the assignment of 10 adjacent pixel, 8-Bit each. This assignment is compatible to Baslers A504 camera.

Plug 1, Camera Link® X	Plug 2, Camera Link® Y	Plug 2, Camera Link® Z

9.5 Frequency selection

Depending on the selected line length and the datarate on the "Camera Link®" interface the frequency selection table can provide an optimal ratio of sensor /pixel clock. The pixel clock is only dependent on the selected step and not on the linelength.

The sensor clock is dependent on both the selected step, the line length and the data width. The tables show the selectable frequencies and the correponding codes to program the synthesizer accordingly.

9.5.1 Frequencies for video data width 2*8/10 - Bit, Base Camera Link®

9.5.1.1 Linelength <= 100 Pixel

clock	pixel clock in MHz	Sensorclock (MHz) for	Framerate (fps) for resolution: 100 x 100

Table 9.5-5

There is a 3-byte code for each frequency. The code for the sensor clock is set to sb1...3 of a <u>returned</u> <u>PowerUpProfile</u> (command :w).

The code of the pixel frequency corresponds to sa1...3.

Example: return of frequency codes

On command :w following answer was returned:

61788b	Sa13, pixel clock (see code of table 20)
	61788b = step 9, equivalent to 27,5 MHz
41da08	Sb13, sensor clock
	according to table 20, mode 3
	41da08= step9, equivalent to 5,6 MHz
07f	Line length 1280 pixel

9.7 Timing

9.7.1 Pixel clock

The above illustration shows hold time of video data, LVAL and FVAL signal to rising edge of pixel clock.

9.7.2 Line Valid (LVAL, DVAL)

LVAL and DVAL are connected internally in the camera. The timing for the LVAL / DVAL signal shown in multiples of the pixel clock depend on the ratio of sensor/pixel clock, on selected line length, and on video data width. Tldvh is always the same for a specific setting of the above parameters, Tldvl my vary by one clock from line to line. The LVAL / DVAL signal is also output while FVAL is inactive.

9.7.3 Frame Valid (FVAL)

The rising edge of FVAL marks that line, that is programmed in Register r1.

Tfdvh is equal to the value programmed in Register r3 multiplied with <u>time/line</u>. Tfdvl in <u>synchronous</u> <u>mode</u> is equal to one <u>time/line</u>.

9.7.4 Exposure Signal (EXP)

The EXP signal is positive active if register 7, Bit 8 = 0, negative active if register 7, Bit 8 = 1. EXP Signal may not be asserted while the previous image is output (FDV active)

The sensors exposure starts and the <u>strobe output</u> activates (texp, (1) three sensor clocks after the active edge of the EXP signal (tshut), and ends up to 135 sensor clocks after deactivation (2).

- 1) The active edge of the EXP signal clears the horizontal counter.
- 2) End of exposure time is synchronised with the internal horizontal counter.

EXP is also used as enable signal for ImageBLITZ shutter release.
