Dual 4-Stage Binary Ripple Counter with ÷ 2 and ÷ 5 Sections

High−Performance Silicon−Gate CMOS

MC74HC390A

The MC74HC390A is identical in pinout to the LS390. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

This device consists of two independent 4−bit counters, each composed of a divide−by−two and a divide−by−five section. The divide−by−two and divide−by−five counters have separate clock inputs, and can be cascaded to implement various combinations of ÷ 2 and/or ÷ 5 up to a ÷ 100 counter.

Flip−flops internal to the counters are triggered by high−to−low transitions of the clock input. A separate, asynchronous reset is provided for each 4−bit counter. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used as clocks or strobes except when gated with the Clock of the HC390A.

PIN DESCRIPTIONS

INPUTS

Clock A (Pins 1, 15) and Clock B (Pins 4, 15)

Clock A is the clock input to the ÷ 2 counter; Clock B is the clock input to the ÷ 5 counter. The internal flip−flops are toggled by high−to−low transitions of the clock input.

CONTROL INPUTS

Reset (Pins 2, 14)

Asynchronous reset. A high at the Reset input prevents counting, resets the internal flip−flops, and forces Q_A through Q_D low.

OUTPUTS

Q_A (Pins 3, 13)

Output of the ÷ 2 counter.

Q_B, Q_C, Q_D (Pins 5, 6, 7, 9, 10, 11)

Outputs of the ÷ 5 counter. Q_D is the most significant bit. Q_A is the least significant bit when the counter is connected for BCD output as in Figure 7. Q_B is the least significant bit when the counter is operating in the bi−quinary mode as in Figure 8.

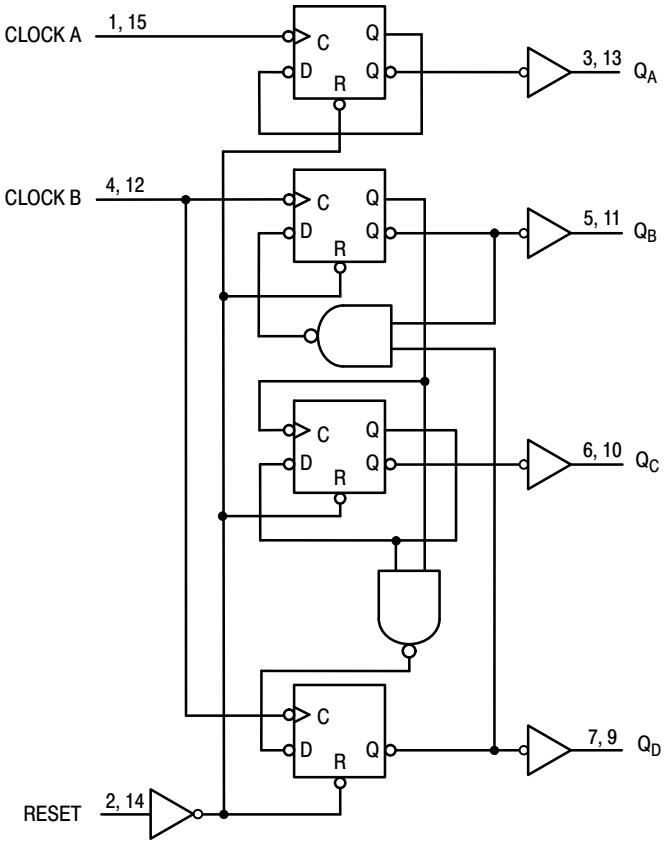

Figure 5. Expanded Logic Diagram

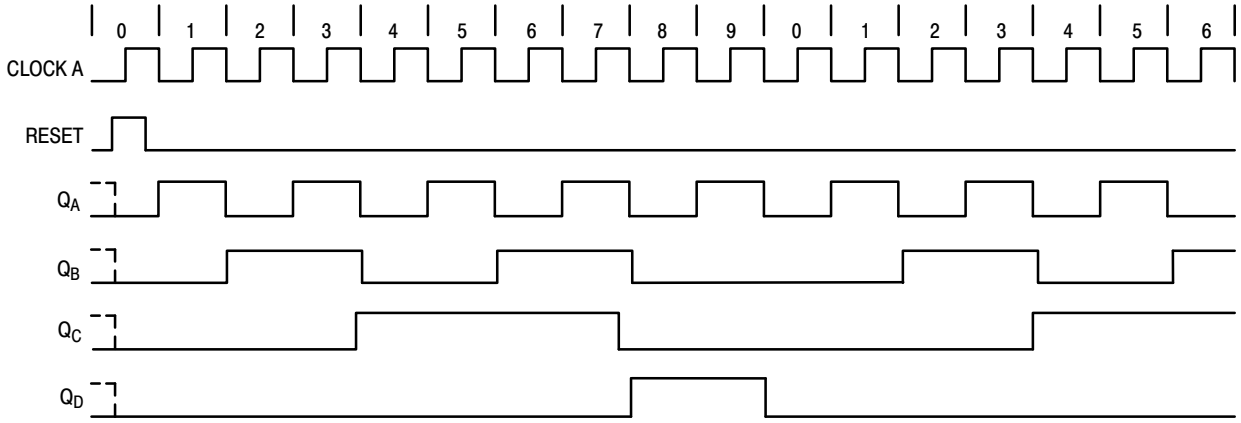

Figure 6. Timing Diagram (Q_A Connected to Clock B)

APPLICATIONS INFORMATION

Each half of the MC54/74HC390A has independent ÷ 2 and ÷ 5 sections (except for the Reset function). The ÷ 2 and ÷ 5 counters can be connected to give BCD or bi−quinary (2−5) count sequences. If Output Q_A is connected to the Clock B input (Figure 4), a decade divider with BCD output is obtained. The function table for the BCD count sequence is given in Table 1.

*Q_A connected to Clock B input.

To obtain a bi−quinary count sequence, the input signals connected to the Clock B input, and output Q_D is connected to the Clock A input (Figure 8). Q_A provides a 50% duty cycle output. The bi−quinary count sequence function table is given in Table 2.
