

## 24 MHz, 2.5 mA Rail-to-Rail Output (RRO) Op Amps

### Features:

- Gain-Bandwidth Product: 24 MHz
- Slew Rate: 10 V/ $\mu$ s
- Noise: 10 nV/ $\sqrt{\text{Hz}}$  at 1 MHz)
- Low Input Bias Current: 4 pA (typical)
- Ease of Use:
  - Unity-Gain Stable
  - Rail-to-Rail Output
  - Input Range including Negative Rail
  - No Phase Reversal
- Supply Voltage Range: +2.5V to +5.5V
- High Output Current:  $\pm 70$  mA
- Supply Current: 2.5 mA/ch (typical)
- Low-Power Mode: 1  $\mu$ A/ch
- Small Packages: SOT23-5, DFN
- Extended Temperature Range: -40°C to +125°C

### Typical Applications:

- Fast Low-Side Current Sensing
- Point-of-Load Control Loops
- Power Amplifier Control Loops
- Barcode Scanners
- Optical Detector Amplifier
- Multi-Pole Active Filter

### Design Aids:

- SPICE Macro Models
- FilterLab® Software
- Microchip Advanced Part Selector (MAPS)
- Analog Demonstration and Evaluation Boards
- Application Notes

### Description:

The Microchip Technology Inc. MCP631/2/3/4/5/9 family of operational amplifiers features high gain bandwidth product (24 MHz, typical) and high output short-circuit current (70 mA, typical). Some also provide a Chip Select ( $\overline{\text{CS}}$ ) pin that supports a low-power mode of operation. These amplifiers are optimized for high speed, low noise and distortion, single-supply operation with rail-to-rail output and an input that includes the negative rail.

This family is offered in single (MCP631), single with CS pin (MCP633), dual (MCP632), dual with two CS pins (MCP635), quad (MCP634) and quad with two Chip Select pins (MCP639). All devices are fully specified from -40°C to +125°C.

## 1.0 ELECTRICAL CHARACTERISTICS

### 1.1 Absolute Maximum Ratings †

$V_{DD} - V_{SS}$	6.5V
Current at Input Pins	±2 mA
Analog Inputs ( $V_{IN+}$ and $V_{IN-}$ ) ††	$V_{SS} - 1.0V$ to $V_{DD} + 1.0V$
All other Inputs and Outputs	$V_{SS} - 0.3V$ to $V_{DD} + 0.3V$
Output Short-Circuit Current	Continuous
Current at Output and Supply Pins	±150 mA
Storage Temperature	-65°C to +150°C
Maximum Junction Temperature	+150°C
ESD protection on all pins (HBM, MM)	≥ 1 kV, 200V

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

†† See Section 4.1.2 “Input Voltage and Current Limits”.

### 1.3 Timing Diagram

**FIGURE 1-1:** Timing Diagram.

### 1.4 Test Circuits

The circuit used for most DC and AC tests is shown in [Figure 1-2](#). It independently sets  $V_{CM}$  and  $V_{OUT}$ ; see [Equation 1-1](#). The circuit's Common-Mode voltage is  $(V_P + V_M)/2$ , not  $V_{CM}$ .  $V_{OST}$  includes  $V_{OS}$  plus the effects of temperature, CMRR, PSRR and  $A_{OL}$ .

### EQUATION 1-1:

$$G_{DM} = \frac{R_F}{R_G}$$

$$G_N = 1 + G_{DM}$$

$$V_{CM} = V_P \left( 1 - \frac{I}{G_N} \right) + V_{REF} \left( \frac{I}{G_N} \right)$$

$$V_{OST} = V_{IN-} - V_{IN+}$$

$$V_{OUT} = V_{REF} + (V_P - V_M)G_{DM} + V_{OST}G_N$$

Where:

$G_{DM}$	= Differential Mode Gain	(V/V)
$G_N$	= Noise Gain	(V/V)
$V_{CM}$	= Op Amp's Common-Mode Input Voltage	(V)
$V_{OST}$	= Op Amp's Total Input Offset Voltage	(mV)

## 3.1 Analog Outputs

The analog output pins ( $V_{OUT}$ ) are low-impedance voltage sources.

## 3.2 Analog Inputs

The non-inverting and inverting inputs ( $V_{IN+}$ ,  $V_{IN-}$ , ...) are high-impedance CMOS inputs with low bias currents.

## 3.3 Power Supply Pins

The positive power supply ( $V_{DD}$ ) is 2.5V to 5.5V higher than the negative power supply ( $V_{SS}$ ). For normal operation, the other pins are between  $V_{SS}$  and  $V_{DD}$ .

Typically, these parts are used in a single (positive) supply configuration. In that case,  $V_{SS}$  is connected to ground and  $V_{DD}$  is connected to the supply.  $V_{DD}$  will need bypass capacitors.

## 3.4 Chip Select Digital Input ( $\overline{CS}$ )

This input ( $\overline{CS}$ ) is a CMOS, Schmitt-triggered input that places the part into a low-power mode of operation.

## 3.5 Exposed Thermal Pad (EP)

There is an internal connection between the exposed thermal pad (EP) and the  $V_{SS}$  pin; they must be connected to the same potential on the printed circuit board (PCB).

This pad can be connected to a PCB ground plane to provide a larger heat sink. This improves the package thermal resistance ( $\theta_{JA}$ ).

## 4.0 APPLICATIONS

The MCP631/2/3/4/5/9 family is manufactured using the Microchip state-of-the-art CMOS process. It is designed for low-cost, low-power and high-speed applications. Its low supply voltage, low quiescent current and wide bandwidth make the MCP631/2/3/4/5/9 ideal for battery-powered applications.

### 4.1 Input

#### 4.1.1 PHASE REVERSAL

The input devices are designed to exhibit no phase inversion when the input pins exceed the supply voltages. Figure 2-38 shows an input voltage exceeding both supplies with no phase inversion.

#### 4.1.2 INPUT VOLTAGE AND CURRENT LIMITS

The electrostatic discharge (ESD) protection on the inputs can be depicted as shown in Figure 4-1. This structure was chosen to protect the input transistors and to minimize input bias current ( $I_B$ ). The input ESD diodes clamp the inputs when they try to go more than one diode drop below  $V_{SS}$ . They also clamp any voltages that go too far above  $V_{DD}$ ; their breakdown voltage is high enough to allow normal operation and low enough to bypass quick ESD events within the specified limits.

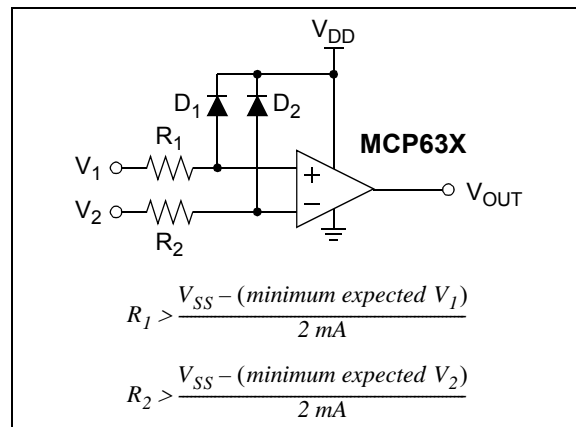

**FIGURE 4-1:** Simplified Analog Input ESD Structures.

In order to prevent damage and/or improper operation of these amplifiers, the circuit must limit the currents (and voltages) at the input pins (see Section 1.1 “Absolute Maximum Ratings †”). Figure 4-2 shows the recommended approach to protecting these inputs.

The internal ESD diodes prevent the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) from going too far below ground, while the resistors  $R_1$  and  $R_2$  limit the possible current drawn out of the input pins. Diodes  $D_1$  and  $D_2$  prevent the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) from going too far above  $V_{DD}$  and dump any currents onto  $V_{DD}$ .

When implemented as shown, resistors  $R_1$  and  $R_2$  also limit the current through  $D_1$  and  $D_2$ .

**FIGURE 4-2:** Protecting the Analog Inputs.

It is also possible to connect the diodes to the left of the resistors  $R_1$  and  $R_2$ . If so, the currents through the diodes  $D_1$  and  $D_2$  need to be limited by some other mechanism. The resistors then serve as in-rush current limiters; the DC current into the input pins ( $V_{IN+}$  and  $V_{IN-}$ ) should be very small.

A significant amount of current can flow out of the inputs (through the ESD diodes) when the Common-Mode voltage ( $V_{CM}$ ) is below ground ( $V_{SS}$ ); see Figure 2-13. Applications that are high-impedance may need to limit the usable voltage range.

#### 4.1.3 NORMAL OPERATION

The input stage of the MCP631/2/3/4/5/9 op amps uses a differential PMOS input stage. It operates at low Common-Mode input voltages ( $V_{CM}$ ), with  $V_{CM}$  between  $V_{SS} - 0.3V$  and  $V_{DD} - 1.3V$ . To ensure proper operation, the input offset voltage ( $V_{OS}$ ) is measured at both  $V_{CM} = V_{SS} - 0.3V$  and  $V_{CM} = V_{DD} - 1.3V$ . See Figures 2-5 and 2-6 for temperature effects.

When operating at very low non-inverting gains, the output voltage is limited at the top by the  $V_{CM}$  range ( $< V_{DD} - 1.3V$ ); see Figure 4-3.

**FIGURE 4-3:** Unity-Gain Voltage Limitations for Linear Operation.

## 4.2 Rail-to-Rail Output

### 4.2.1 MAXIMUM OUTPUT VOLTAGE

The maximum output voltage (see [Figures 2-16](#) and [2-17](#)) describes the output range for a given load. For instance, the output voltage swings to within 50 mV of the negative rail with a 1 kΩ load tied to  $V_{DD}/2$ .

### 4.2.2 OUTPUT CURRENT

[Figure 4-4](#) shows the possible combinations of output voltage ( $V_{OUT}$ ) and output current ( $I_{OUT}$ ), when  $V_{DD} = 5.5V$ .

$I_{OUT}$  is positive when it flows out of the op amp into the external circuit.

**FIGURE 4-4:** Output Current.

### 4.2.3 POWER DISSIPATION

Since the output short-circuit current ( $I_{SC}$ ) is specified at  $\pm 70$  mA (typical), these op amps are capable of both delivering and dissipating significant power.

**FIGURE 4-5:** Diagram for Power Calculations.

[Figure 4-5](#) shows the power calculations used for a single op amp:

- $R_{SER}$  is 0Ω in most applications and can be used to limit  $I_{OUT}$ .
- $V_{OUT}$  is the op amp's output voltage.
- $V_L$  is the voltage at the load.
- $V_{LG}$  is the load's ground point.
- $V_{SS}$  is usually ground (0V).

The input currents are assumed to be negligible. The currents shown in [Figure 4-5](#) can be approximated using [Equation 4-1](#):

#### EQUATION 4-1:

$$I_{OUT} = I_L = \frac{V_{OUT} - V_{LG}}{R_{SER} + R_L}$$

$$I_{DD} \approx I_Q + \max(0, I_{OUT})$$

$$I_{SS} \approx -I_Q + \min(0, I_{OUT})$$

Where:

$I_Q$  = Quiescent supply current

The instantaneous op amp power ( $P_{OA}(t)$ ),  $R_{SER}$  power ( $P_{RSE}(t)$ ) and load power ( $P_L(t)$ ) are:

#### EQUATION 4-2:

$$P_{OA}(t) = I_{DD}(V_{DD} - V_{OUT}) + I_{SS}(V_{SS} - V_{OUT})$$

$$P_{RSE}(t) = I_{OUT}^2 R_{SER}$$

$$P_L(t) = I_L^2 R_L$$

The maximum op amp power, for resistive loads, occurs when  $V_{OUT}$  is halfway between  $V_{DD}$  and  $V_{LG}$  or halfway between  $V_{SS}$  and  $V_{LG}$ .

#### EQUATION 4-3:

$$P_{OAm} \leq \frac{\max^2(V_{DD} - V_{LG}, V_{LG} - V_{SS})}{4(R_{SER} + R_L)}$$

The maximum ambient to junction temperature rise ( $\Delta T_{JA}$ ) and junction temperature ( $T_J$ ) can be calculated using  $P_{OAm}$ , the ambient temperature ( $T_A$ ), the package thermal resistance ( $\theta_{JA}$ , found in the [Temperature Specifications](#) table) and the number of op amps in the package (assuming equal power dissipations), as shown in [Equation 4-4](#):

#### EQUATION 4-4:

$$\Delta T_{JA} = P_{OA}(t) \theta_{JA} \leq n P_{OAm} \theta_{JA}$$

$$T_J = T_A + \Delta T_{JA}$$

Where:

$n$  = Number of op amps in the package (1, 2)

# MCP631/2/3/4/5/9

The power derating across temperature for an op amp in a particular package can be easily calculated (assuming equal power dissipations):

## EQUATION 4-5:

$$P_{OAm_{ax}} \leq \frac{T_{Jmax} - T_A}{n \theta_{JA}}$$

Where:

$T_{Jmax}$  = Absolute maximum junction temperature

Several techniques are available to reduce  $\Delta T_{JA}$  for a given  $P_{OAm_{ax}}$ :

- Lower  $\theta_{JA}$ 
  - Use another package
  - PCB layout (ground plane, etc.)
  - Heat sinks and air flow
- Reduce  $P_{OAm_{ax}}$ 
  - Increase  $R_L$
  - Limit  $I_{OUT}$  (using  $R_{SER}$ )
  - Decrease  $V_{DD}$

## 4.3 Improving Stability

### 4.3.1 CAPACITIVE LOADS

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the phase margin (stability) of the feedback loop decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. A unity-gain buffer ( $G = +1$ ) is the most sensitive to capacitive loads, though all gains show the same general behavior.

When driving large capacitive loads with these op amps (e.g.,  $> 20$  pF when  $G = +1$ ), a small series resistor at the output ( $R_{ISO}$  in Figure 4-6) improves the phase margin of the feedback loop by making the output load resistive at higher frequencies. The bandwidth will be generally lower than the bandwidth with no capacitive load.

**FIGURE 4-6:** Output Resistor,  $R_{ISO}$ , Stabilizes Large Capacitive Loads.

Figure 4-7 gives recommended  $R_{ISO}$  values for different capacitive loads and gains. The x-axis is the normalized load capacitance ( $C_L/G_N$ ), where  $G_N$  is the circuit's noise gain. For non-inverting gains,  $G_N$  and the Signal Gain are equal. For inverting gains,  $G_N$  is  $1 + |\text{Signal Gain}|$  (e.g.,  $-1$  V/V gives  $G_N = +2$  V/V).

**FIGURE 4-7:** Recommended  $R_{ISO}$  Values for Capacitive Loads.

After selecting  $R_{ISO}$ , double-check the resulting frequency response peaking and step response overshoot. Modify the value of  $R_{ISO}$  until the response is reasonable. Bench evaluation and simulations with the MCP631/2/3/4/5/9 SPICE macro model are helpful.

### 4.3.2 GAIN PEAKING

Figure 4-8 shows an op amp circuit that represents non-inverting amplifiers ( $V_M$  is a DC voltage and  $V_P$  is the input) or inverting amplifiers ( $V_P$  is a DC voltage and  $V_M$  is the input). The capacitances  $C_N$  and  $C_G$  represent the total capacitance at the input pins; they include the op amp's Common-Mode input capacitance ( $C_{CM}$ ), board parasitic capacitance and any capacitor placed in parallel.

**FIGURE 4-8:** Amplifier with Parasitic Capacitance.

$C_G$  acts in parallel with  $R_G$  (except for a gain of  $+1$  V/V), which causes an increase in gain at high frequencies.  $C_G$  also reduces the phase margin of the feedback loop, which becomes less stable. This effect can be reduced by either reducing  $C_G$  or  $R_F$ .

$C_N$  and  $R_N$  form a low-pass filter that affects the signal at  $V_P$ . This filter has a single real pole at  $1/(2\pi R_N C_N)$ .

The largest value of  $R_F$  that should be used depends on the noise gain (see  $G_N$  in **Section 4.3.1 “Capacitive Loads”**),  $C_G$  and the open-loop gain's phase shift. **Figure 4-9** shows the maximum recommended  $R_F$  for several  $C_G$  values. Some applications may modify these values to reduce either output loading or gain peaking (step response overshoot).

**FIGURE 4-9:** Maximum Recommended  $R_F$  vs. Gain.

**Figures 2-34 and 2-35** show the small signal and large signal step responses at  $G = +1$  V/V. The unity-gain buffer usually has  $R_F = 0\Omega$  and  $R_G$  open.

**Figures 2-36 and 2-37** show the small signal and large signal step responses at  $G = -1$  V/V. Since the noise gain is 2 V/V and  $C_G \approx 10$  pF, the resistors were chosen to be  $R_F = R_G = 1$  k $\Omega$  and  $R_N = 500\Omega$ .

It is also possible to add a capacitor ( $C_F$ ) in parallel with  $R_F$  to compensate for the destabilizing effect of  $C_G$ . This makes it possible to use larger values of  $R_F$ . The conditions for stability are summarized in **Equation 4-6**.

## EQUATION 4-6:

Given:

$$G_{N1} = 1 + \frac{R_F}{R_G}$$

$$G_{N2} = 1 + \frac{C_G}{C_F}$$

$$f_F = \frac{1}{2\pi R_F C_F}$$

$$f_Z = f_F \left( \frac{G_{N1}}{G_{N2}} \right)$$

We need:

$$f_F \leq \frac{f_{GBWP}}{2G_{N2}}, G_{N1} < G_{N2}$$

$$f_F \leq \frac{f_{GBWP}}{4G_{N1}}, G_{N1} > G_{N2}$$

## 4.4 MCP633, MCP635 and MCP639 Chip Select

The MCP633 is a single amplifier with Chip Select ( $\overline{CS}$ ). When  $\overline{CS}$  is pulled high, the supply current drops to 1  $\mu$ A (typical) and flows through the  $\overline{CS}$  pin to  $V_{SS}$ . When this happens, the amplifier output is put into a high-impedance state. By pulling  $\overline{CS}$  low, the amplifier is enabled. The  $\overline{CS}$  pin has an internal 5 M $\Omega$  (typical) pull-down resistor connected to  $V_{SS}$ , so it will go low if the  $\overline{CS}$  pin is left floating. **Figures 1-1, 2-42 and 2-43** show the output voltage and supply current response to a  $\overline{CS}$  pulse.

The MCP635 is a dual amplifier with two  $\overline{CS}$  pins;  $\overline{CSA}$  controls op amp A and  $\overline{CSB}$  controls op amp B. These op amps are controlled independently, with an enabled quiescent current ( $I_Q$ ) of 2.5 mA/amplifier (typical) and a disabled  $I_Q$  of 1  $\mu$ A/amplifier (typical). The  $I_Q$  seen at the supply pins is the sum of the two op amps'  $I_Q$ ; the typical value for the  $I_Q$  of the MCP635 will be 2  $\mu$ A, 2.5 mA or 5 mA when there are 0, 1 or 2 amplifiers enabled, respectively.

The MCP639 is a quad amplifier with two  $\overline{CS}$  pins;  $\overline{CSB}$  controls op amp B and  $\overline{CSD}$  controls op amp D.

## 4.5 Power Supply

With this family of operational amplifiers, the Power Supply pin ( $V_{DD}$  for single supply) should have a local bypass capacitor (i.e., 0.01  $\mu$ F to 0.1  $\mu$ F) within 2 mm for good high-frequency performance. Surface mount, multilayer ceramic capacitors, or their equivalent, should be used.

These op amps require a bulk capacitor (i.e., 2.2  $\mu$ F or larger) within 50 mm to provide large, slow currents. Tantalum capacitors, or their equivalent, may be a good choice. This bulk capacitor can be shared with other nearby analog parts as long as crosstalk through the supplies does not prove to be a problem.

# MCP631/2/3/4/5/9

## 4.6 High-Speed PCB Layout

These op amps are fast enough that a little extra care in the printed circuit board (PCB) layout can make a significant difference in performance. Good PCB layout techniques will help achieve the performance shown in the specifications and typical performance curves; it will also help minimize electromagnetic compatibility (EMC) issues.

Use a solid ground plane. Connect the bypass local capacitor(s) to this plane with minimal length traces. This cuts down inductive and capacitive crosstalk.

Separate digital from analog, low-speed from high-speed, and low-power from high-power. This will reduce interference.

Keep sensitive traces short and straight. Separate them from interfering components and traces. This is especially important for high-frequency (low rise time) signals.

Sometimes, it helps to place guard traces next to victim traces. They should be on both sides of the victim trace and as close as possible. Connect guard traces to ground plane at both ends and in the middle for long traces.

Use coax cables, or low-inductance wiring, to route signal and power to and from the PCB. Mutual and self-inductance of power wires is often a cause of crosstalk and unusual behavior.

## 4.7 Typical Applications

### 4.7.1 POWER DRIVER WITH HIGH GAIN

Figure 4-10 shows a power driver with high gain ( $1 + R_2/R_1$ ). The short-circuit current of the MCP631/2/3/4/5/9 op amps makes it possible to drive significant loads. The calibrated input offset voltage supports accurate response at high gains.  $R_3$  should be small and equal to  $R_1 || R_2$  in order to minimize the bias current induced offset.

FIGURE 4-10: Power Driver.

### 4.7.2 OPTICAL DETECTOR AMPLIFIER

Figure 4-11 shows a transimpedance amplifier, using the MCP63X op amp, in a photo detector circuit. The photo detector is a capacitive current source.  $R_F$  provides enough gain to produce 10 mV at  $V_{OUT}$ .  $C_F$  stabilizes the gain and limits the transimpedance bandwidth to about 1.1 MHz. The parasitic capacitance of  $R_F$  (e.g., 0.2 pF for a 0805 SMD) acts in parallel with  $C_F$ .

FIGURE 4-11: Transimpedance Amplifier for an Optical Detector.

### 4.7.3 H-BRIDGE DRIVER

Figure 4-12 shows the MCP632 dual op amp used as an H-bridge driver. The load could be a speaker or a DC motor.

FIGURE 4-12: H-Bridge Driver.

This circuit automatically makes the noise gains ( $G_N$ ) equal when the gains are set properly, so that the frequency responses match well (in magnitude and in phase). Equation 4-7 shows how to calculate  $R_{GT}$  and  $R_{GB}$  so that both op amps have the same DC gains;  $G_{DM}$  needs to be selected first.

## EQUATION 4-7:

$$G_{DM} \equiv \frac{V_{OT} - V_{OB}}{V_{IN} - \frac{V_{DD}}{2}} \geq 1 \text{ V/V}$$

$$R_{GT} = \frac{R_F}{\frac{G_{DM}}{2} - 1}$$

$$R_{GB} = \frac{R_F}{\frac{G_{DM}}{2}}$$

Equation 4-8 gives the resulting Common-Mode and Differential mode output voltages.

## EQUATION 4-8:

$$\frac{V_{OT} + V_{OB}}{2} = \frac{V_{DD}}{2}$$

$$V_{OT} - V_{OB} = G_{DM} \left( V_{IN} - \frac{V_{DD}}{2} \right)$$

## 5.0 DESIGN AIDS

Microchip provides the basic design aids needed for the MCP631/2/3/4/5/9 family of op amps.

### 5.1 SPICE Macro Model

The latest SPICE macro model for the MCP631/2/3/4/5/9 op amps is available on the Microchip web site at [www.microchip.com](http://www.microchip.com). This model is intended to be an initial design tool that works well in the linear region of operation over the temperature range of the op amp. See the model file for information on its capabilities.

Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specifications and characteristic curves.

### 5.2 FilterLab® Software

Microchip's FilterLab® software is an innovative software tool that simplifies analog active filter (using op amps) design. Available at no cost from the Microchip web site at [www.microchip.com/filterlab](http://www.microchip.com/filterlab), the FilterLab design tool provides full schematic diagrams of the filter circuit with component values. It also outputs the filter circuit in SPICE format, which can be used with the macro model to simulate actual filter performance.

### 5.3 Microchip Advanced Part Selector (MAPS)

MAPS is a software tool that helps efficiently identify Microchip devices that fit a particular design requirement. Available at no cost from the Microchip web site at [www.microchip.com/maps](http://www.microchip.com/maps), the MAPS is an overall selection tool for Microchip's product portfolio that includes Analog, Memory, MCUs and DSCs. Using this tool, a filter can be defined to sort features for a parametric search of devices and export side-by-side technical comparison reports. Helpful links are also provided for data sheets, purchase and sampling of Microchip parts.

## 5.4 Analog Demonstration and Evaluation Boards

Microchip offers a broad spectrum of analog demonstration and evaluation boards that are designed to help customers achieve faster time to market. For a complete listing of these boards and their corresponding user's guides and technical information, visit the Microchip web site at [www.microchip.com/analogtools](http://www.microchip.com/analogtools).

Some boards that are especially useful are:

- **MCP6XXX Amplifier Evaluation Board 1**, part number: MCP6XXXEV-AMP1
- **MCP6XXX Amplifier Evaluation Board 2**, part number: MCP6XXXEV-AMP2
- **MCP6XXX Amplifier Evaluation Board 3**, part number: MCP6XXXEV-AMP3
- **MCP6XXX Amplifier Evaluation Board 4**, part number: MCP6XXXEV-AMP4
- **Active Filter Demo Board Kit**, part number: MCP6XXXDM-FLTR
- **8-Pin SOIC/MSOP/TSSOP/DIP Evaluation Board**, part number: SOIC8EV

## 5.5 Application Notes

### 8-Lead Plastic Dual Flat, No Lead Package (MF) - 3x3x0.9mm Body [DFN]

The drawing illustrates a mechanical part with two views: TOP VIEW and BOTTOM VIEW. Key features and tolerances include:

- TOP VIEW:**
  - Feature Control Frame 1:  $\text{2X } \left[ \begin{array}{|c|c|c|} \hline \text{R} & 0.10 & \text{C} \end{array} \right]$  (Applied to a circular feature).
  - Feature Control Frame 2:  $\text{2X } \left[ \begin{array}{|c|c|c|} \hline \text{R} & 0.10 & \text{C} \end{array} \right]$  (Applied to another circular feature).
  - Feature Control Frame 3:  $\left[ \begin{array}{|c|c|c|} \hline \text{A} & 0.10 & \text{C} \end{array} \right]$  (Applied to a surface).
  - Feature Control Frame 4:  $\text{8X } \left[ \begin{array}{|c|c|c|} \hline \text{R} & 0.08 & \text{C} \end{array} \right]$  (Applied to a circular feature).
  - Feature Control Frame 5:  $\left[ \begin{array}{|c|c|c|c|c|c|} \hline \text{A} & 0.10 & \text{M} & \text{C} & \text{A} & \text{B} \end{array} \right]$  (Applied to a circular feature).

## APPENDIX A: REVISION HISTORY

### Revision C (July 2014)

The following is the list of modifications:

1. Updated the [Features](#): list.
2. Added the [High Gain-Bandwidth Op Amp Portfolio](#) table in the [Features](#): section.
3. Updated [Figures 4-6](#) and [4-11](#).
4. Updated **Section 6.0 “Packaging Information”** and **Section 6.1 “Package Marking Information”**.
5. Minor typographical changes.

### Revision B (November 2011)

The following is the list of modifications:

1. Added the MCP634 and MCP639 amplifiers to the product family and the related information throughout the document.
2. Added the 2x3 TDFN (8L), SOT23 (5L) package option for MCP631, SOT23 (6L) package option for MCP633, 4x4 QFN (16L) package option for MCP639, SOIC and TSSOP (14L) package options for MCP634 and the related information throughout the document. Updated package types drawing with pin designation for each new package.
3. Updated the [Temperature Specifications](#) table to show the temperature specifications for new packages.
4. Updated [Table 3-1](#) to show all the pin functions.
5. Updated **Section 6.0 “Packaging Information”** with markings for the new additions. Added the corresponding SOT23 (5L), SOT23 (6L), TDFN (8L), SOIC, TSSOP (14L), and 4x4 QFN (16L) package options and related information.
6. Updated table description and examples in the Product Identification System section.

### Revision A (August 2009)

- Original Release of this Document.

# MCP631/2/3/4/5/9

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM**  
**CERTIFIED BY DNV**  
**== ISO/TS 16949 ==**

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
