

# MCS7705

## USB 1.1 to Single Parallel Controller

### Features

- Single 5V Operation
- Low Power
- USB Specification 1.1 compliant
- Operation over the extended USB Bus voltage range (4.5 to 5.5V)
- On-Chip 3.3V Voltage Regulator
- Internal Power-On Reset
- Single Printer Port Interface
- 2KV In-Circuit ESD protection for lower cost of external components
- Available in 48-Pin QFP Package

### Applications

- Printer Server
- Printer Interface

### Application Note

- AN-7705

### Evaluation Board

- MCS7705-EVB

### General Description

The MCS7705 controller provides bridging between the Universal Serial Bus (USB) port, and a Parallel Printer port. This device contains all the necessary logic to communicate with the host computer via the USB Bus. It supports Printers with hardware accelerated SPP mode.

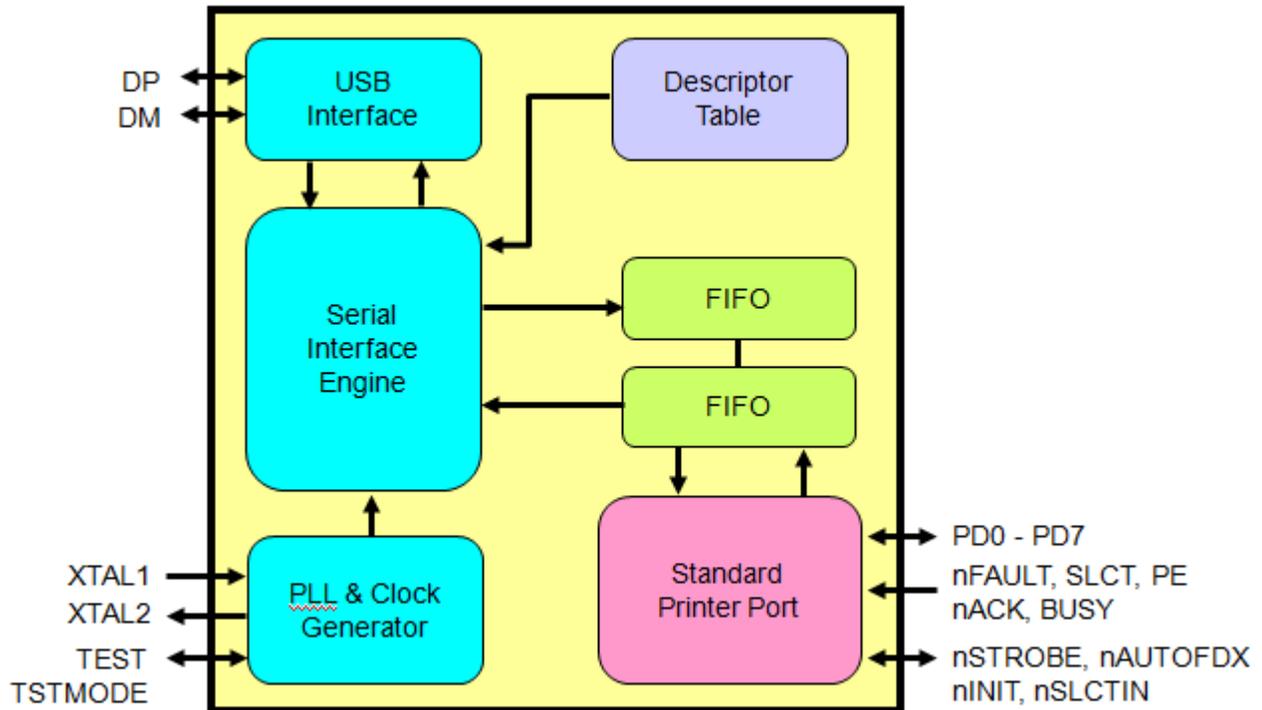

In addition, the MCS7705 contains a 3.3V regulator and operates in Bus-Powered mode.

The MCS7705 has a reduced frequency (6MHz) crystal oscillator. This combination of features allows significant cost savings in system design along with straightforward implementation of Parallel Printer port functionality into PC peripherals using the host's USB port.

### Ordering Information

Commercial Grade (0° C to +70° C)

# MCS7705 USB 1.1 to Single Parallel Controller

## Pin-out

**Pin Assignments**

Pin Name	Pin	Type	Description
XTAL1	3	I	Crystal Oscillator input, or External Clock input pin (6 MHz). This signal input is used in conjunction with XTAL2 to form a feedback circuit for the internal timing. Two (10 pF) external capacitors connected from each side of the crystal to GND are required to form a Crystal Oscillator.
XTAL2	4	O	Crystal Oscillator output. See XTAL1 description.
TSTPLL	6	I	Test Mode (active low, internal pull-up). When this pin is tied to GND, the internal PLL is bypassed and an external 48 MHz clock is used as the reference clock.
TSTMODE	7	I	Internal Test Mode (active low, internal pull-up). When this pin is tied to GND, the Internal Test Mode is enabled.
DM	9	I/O	Upstream USB port differential Data Minus (D-), analog.
DP	10	I/O	Upstream USB port differential Data Plus (D+), analog.
RESET	12	I	System Reset (active high). Resets all internal registers, sequencers, and signals to a consistent state. Connect to GND to use the internal Power-On-Reset circuit.
SLCT	22	I	Peripheral/Printer Selected (internal pull-up). This pin is set high by the peripheral/printer when it is selected.
PE	23	I	Paper Empty (internal pull-up). This pin is set high by the peripheral/printer when printer paper is empty.
BUSY	24	I	Peripheral/Printer Busy (internal pull-up). This pin is set high by the peripheral/printer when the printer or peripheral is not ready to accept data.
nACK	25	I	Peripheral/Printer data Acknowledge (internal pull-up). This pin is set low by the peripheral/printer to indicate a successful data transfer has taken place.
PD7	26	I/O	Parallel printer port Data bit 7.
PD6	27	I/O	Parallel printer port Data bit 6.
PD5	29	I/O	Parallel printer port Data bit 5.
PD4	32	I/O	Parallel printer port Data bit 4.
PD3	33	I/O	Parallel printer port Data bit 3.

# MCS7705

## USB 1.1 to Single Parallel Controller

Pin Name	Pin	Type	Description
nSLCTIN	34	I/O	Peripheral/Printer Select (open-drain). Selects the peripheral/printer when it is set low.
PD2	35	I/O	Parallel printer port Data bit 2.
nINIT	36	I/O	Initialize the peripheral/printer (open drain). When set low, the peripheral/printer starts its initialization routine.
PD1	37	I/O	Parallel printer port Data bit 1.
nFAULT	38	I	Peripheral/Printer data error (internal pull-up). This pin is set low by the peripheral/printer during an error condition.
PD0	40	I/O	Parallel printer port Data bit 0.
nAUTOFDX	41	I/O	Peripheral/Printer Auto Feed (open-drain). Continuous autofed paper is selected when this pin is set low.
nSTROBE	42	I/O	Peripheral/Printer data Strobe (open drain). Data is latched into the peripheral/printer when the nSTROBE is low.
VOUT	48	PWR	+3.3V Voltage Regulator output.
GND	5,8,13,46, 14, 17,21, 30, 39,47	PWR	Power and Signal Ground.
3.3V	2, 11, 16, 31, 43	PWR	Device Supply Inputs. All should be connected to the VOUT pin. VOUT voltage is gated by RESET.
5V	1	PWR	Main Power Input. Connect to USB VBUS or local VDD.

**Note:** All names with “n” prefix are active low.

**MCS7705**

## **USB 1.1 to Single Parallel Controller**

### **USB Description**

#### **Analog Transceivers**

The on-chip transceivers are connected directly to USB cables through external series resistors. They transmit and receive serial data at both full-speed (12Mbit/s) and low-speed (1.5Mbit/s) data rates. Slew rates are automatically adjusted according to the speed of the device connected and lie within the range defined in the *USB Specification Rev. 1.1*.

#### **Serial Interface Engine**

This engine implements the complete USB protocol layer including: parallel /serial conversion, synchronization pattern recognition, CRC checking/generation, bit (de)stuffing, packet identifier (PID) verification/generation, address recognition and handshake evaluation/generation.

#### **Bit Clock Recovery**

The bit clock recovery circuit recovers the clock from the incoming USB data stream using 4x over sampling. It is able to track in the presence of jitter and frequency drift as specified by the *USB Specification Rev. 1.1*.

#### **3.3V Source**

A 5V to 3.3V DC-DC regulator is integral to the chip relieving the need for a +3.3V source. It supplies the analog transceivers and internal logic and can be used to supply the 1.5k $\Omega$  pull-up resistor on the DP line of the upstream connection.

#### **PLL Clock Multiplier**

An integral Phase-Locked Loop (PLL) performs 6 to 48MHz clock multiplication and requires no external components except the crystal. This allows for the use of low-cost 6MHz crystals which reduce high frequency radiated Electro-Magnetic Interference (EMI).

**Host Requests**

All standard USB requests from the host are handled via Control Endpoint-0. The Control Endpoint can handle a maximum of 8 Bytes per transfer.

This table shows the supported standard USB requests.

**Note:** the USB data transmission order is Least Significant Bit (LSB) first. In the following tables Multi-Byte variables are displayed least significant Byte first.

**Standard USB Requests**

RequestName	bmRequestType Byte 0 [7:0] (bin)	bRequest Byte 1 (hex)	wValue Byte 2, 3 (hex)	wIndex Byte 4, 5 (hex)	wLength Byte 6, 7 (hex)	Data

**Endpoint Descriptions**

There are three end points apart from the Control Endpoint

Endpoint	Type	Function	Size
0	Control Endpoint	Default Functionality	
1	Bulk-In	Parallel Printer Port	32Bytes
2	Bulk-Out	Parallel Printer Port	32 Bytes
3	Interrupt	Status Endpoint	4 Bytes

**Endpoint  
Descriptor #1  
Bulk-In  
(Parallel Port)**

Offset (Bytes)	Field Name	Size (Bytes)	Value (hex)	Comments
0	bLength	1	07	Descriptor Length = 7 Bytes
1	bDescriptorType	1	05	Type = ENDPOINT
2	bEndpointAddress	1	81	Endpoint-1, direction: IN
3	bmAddress	1	02	Bulk Endpoint
4	wMaxPacketSize	2	20,00	Packet Size = 32 Bytes
6	bInterval	1	FF	Polling Interval (255mS)

**Endpoint  
Descriptor #2  
Bulk-Out  
(Parallel Port)**

Offset (Bytes)	Field Name	Size (Bytes)	Value (hex)	Comments
0	bLength	1	07	Descriptor Length = 7 Bytes
1	bDescriptorType	1	05	Type = ENDPOINT
2	bEndpointAddress	1	02	Endpoint-2, direction: OUT
3	bmAddress	1	02	Bulk Endpoint
4	wMaxPacketSize	2	20,00	Packet Size = 32 Bytes
6	bInterval	1	FF	

Endpoint  
Descriptor #3  
Status Endpoint

Offset (Bytes)	Field Name	Size (Bytes)	Value (hex)	Comments
0	bLength	1	07	Descriptor Length = 7 Bytes
1	bDescriptorType	1	05	Type = ENDPOINT
2	bEndpointAddress	1	87	Endpoint-7, direction: IN
3	bmAddress	1	03	Interrupt Endpoint
4	wMaxPacketSize	2	04,00	Packet Size = 4 Bytes
6	bInterval	1	01	Polling Interval (1mS)

**Status Endpoint:**

The Status Endpoint returns 4 Bytes every 1 millisecond. These four Bytes are status information of the Parallel Printer port.

- Byte-1: Reserved (Unused)
- Byte-2: Reserved (Unused)
- Byte-3: Device Status Register of the Parallel Printer port (DSR)
- Byte-4: FIFO status of the Parallel Printer port.

**Description for Byte-4 of Status Endpoint.**

Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
Reserved	Reserved	Reserved	Reserved	ParOutFifo Empty	ParOutFifo Full	ParInFifo Empty	ParInFifo Full

Bit	Description
ParInFifo Full	1 Indicates the Bulk-In FIFO is full. (Parallel Printer Port)
ParInFifo Empty	1 Indicates the Bulk-In FIFO is empty. (Parallel Printer Port)
ParOutFifo Full	1 Indicates the Bulk-Out FIFO is full. (Parallel Printer Port)
ParOutFifo Empty	1 Indicates the Bulk-Out FIFO is empty. (Parallel Printer Port)

**USB Vendor Specific Commands:**

The purpose of the vendor commands is to configure the Parallel Printer port.  
The following tables provide information for the Vendor Specific Commands.

**PARALLEL PRINTER PORT**

0x40	0x0E	0x01xx	0x000A	0x0000	PP_ECR

**Vendor Specific Command Parameters**

Brequest: specifies whether to Read or Write  
0x0E = write to the application register.  
0x0D = read from the application register.

Wvalue: Specifies the Application Number.  
0x0100 is the application number for the Parallel Printer port.  
0x0200 is reserved.  
0x0000 is the application number provided for accessing the other control registers to control the Parallel Printer port (i.e. Setting the clock frequency, etc.)  
xx specifies the Byte value to be written into the register.

Windex: Is the offset of the register to Read/Write.

Wlength: Is the length of the data we are going to read or write.

**Parallel Printer Port Register Descriptions**

**Data Register**

The Data Register is cleared at initialization by RESET. During a write operation, the contents of this register are buffered and output onto the PD7-PD0 ports. During a read operation PD7-PD0 ports are buffered and output to the host CPU.

**Register:** PP\_DPR  
**Description:** Parallel Printer Data Register  
**Offset:** 000  
**Permissions:** Read/Write  
**Access Condition:** Application Number = 0x0100

Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
Parallel Printer Data							

**Device Status Register**

The bits of the status register are defined as follows:

**Register:** DSR  
**Description:** Device Status Register  
**Offset:** 001  
**Permissions:** Read  
**Access Condition:** Application Number = 0x0100

Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
nBUSY	nACK	PE	SLCT	FAULT	Unused	Unused	Unused

Bit	Name	Description
0	Unused	Not used, set to 0
1	Unused	Not used, set to 0
2	Unused	Not used, set to 0
3	FAULT	Logic 0 = Printer reports error condition Logic 1 = Normal operation.
4	SLCT	Logic 0 = Printer is off line. Logic 1 = Printer is on line.
5	PE	Logic 0 = Normal operation Logic 1 = Paper end/empty is detected
6	nACK	Logic 0 = State of the nACK pin (ACK = High). Logic 1 = State of the nACK pin (ACK = Low).
7	nBUSY	Logic 0 = nBUSY pin is high, printer is not ready to take data. Logic 1 = nBUSY pin is low, printer is ready to take data.

**Device Control Register**

**Register:** DCR  
**Description:** Device Control Register  
**Offset:** 002  
**Permissions:** Read/Write  
**Access Condition:** Application Number = 0x0100

Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
Unused	Unused	DIR	Unused	nSLCTIN	INIT	nAUTOFD	nSTROBE

Bit	Name	Description
0	nSTROBE	Logic 0 = Sets the nSTROBE pin to high. Logic 1 = Sets the nSTROBE pin to low. PD7-PD0 data are latched into printer
1	nAUTOFD	Logic 0 = Sets the nAUTOFD pin to high. Printer generates auto line feed after each line is printed. Logic 1 = Sets the nAUTOFD pin to low. No auto feed function.
2	INIT	Logic 0 = Sets the INIT pin to high. Logic 1 = Sets the INIT pin to low. Peripheral/printer starts its initialization routine.
3	nSLCTIN	Logic 0 = Sets the nSLCTIN pin to high. Selects the printer. Logic 1 = Sets the nSLCTIN pin to low. Printer is not selected.
4	Unused	Not used set to 0
5	DIR	Logic 0 = PD7-PD0 pins are configured for output mode. Logic 1 = PD7-PD0 pins are configured for input mode.
6	Unused	Not used, set to 0.
7	Unused	Not used, set to 0.

**Extended Control Register (ECR)**

This register controls the Parallel Port mode selection operation.

**Register:** PP\_ECR  
**Description:** Parallel Printer Port Extended Control Register  
**Offset:** 0x0A  
**Permissions:** Read/Write  
**Access Condition:** Application Number = 0x0100

Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
Parallel Port Mode			Reserved	Reserved	Reserved	Reserved	Reserved

Bit-7	Bit-6	Bit-5	Operating Mode
0	0	0	SPP
0	0	1	Nibble
0	1	0	CB-FIFO mode
0	1	1	Not Used
1	0	0	Not Used
1	0	1	Not used
1	1	0	Not Used
1	1	1	Not Used

**Mode Changes**

After a hardware reset Nibble Mode is selected as the default mode. It is required to select mode 000 or 001 before any other mode configuration.

**Mode “000”**

**SPP/Centronics/Compatible Mode**

Forward direction only. The direction bit is forced to “0” and PD7-PD0 are set to the output direction. The Parallel Port is under software control. This mode defines the protocol used by most PCs to transfer data to a printer. It is commonly called the “Centronics” mode and is the method utilized with the Standard Parallel Printer port. Data is placed on the PD7-PD0 ports, and the printer status is checked via the DSR register. If no error condition is flagged and the printer is not busy, software toggles the nSTROBE pin to latch the PD7-PD0 data into the printer. This operating cycle continues when the printer/peripheral issues the data acknowledge signal (pulses the ACK and nBUSY pins).

**Mode “001”**

**Nibble Mode**

The Nibble Mode is the most common way to get reverse channel data from the printer or peripheral. This mode is usually combined with the SPP Mode or a proprietary forward channel mode to create a Bi-Directional channel. In this mode printer status bits are used as Nibble bits.

Pin	Data Bit
nBUSY	Bit-7
PE	Bit-6
SLCT	Bit-5
nFAULT	Bit-4
nBUSY	Bit-3
PE	Bit-2
SLCT	Bit-1
nFAULT	Bit-0

**Bit Order for Nibble Mode**

**Mode “010”**

**FIFO Output Mode**

In this mode, Bytes written to the FIFO are transmitted automatically using the SPP/Centronics standard protocol.

**PP\_REGISTER:**

This register is used for internal debugging of UDC controller & bridge circuitry. There is a bit which resets the Parallel Printer port. There are bits which control the input clock fed to the Parallel Printer port.

**Register:** PP\_REG  
**Description:** Parallel Printer Port Register  
**Offset:** 0x04  
**Permissions:** Read/Write  
**Access Condition:** Application Number = 0x0000

Bit[7]	Bit[6]	Bit[5]	Bit[4]	Bit[3]	Bit[2]	Bit[1]	Bit[0]
pp_reset	clk_freq_select			pp_bi_clear	pp_bo_clear	Reserved	udc_loop

Bit	Description
udc_loop	When enabled, loops the data from the Bulk-Out FIFO to the Bulk-In FIFO.
Reserved	Reserved
pp_bo_clear	Reset the Bulk-Out FIFO
pp_bi_clear	Reset the Bulk-In FIFO
clk_freq_select	Changes the clock fed to the Parallel Printer port.
pp_reset	Resets the Parallel Printer port

**pp reset:** This bit will reset the Parallel Printer port. When this bit is a 1 the Parallel Printer port is under the Reset process. Whenever the frequency is to be changed, first set the Reset bit, change the clk\_ frequency, and finally clear the Reset bit to 0.

**clk\_freq\_select:** Changes the clock fed to the Parallel Printer port as shown in the table below.

Option	Input Clock Frequency
3'b000	12 MHz
3'b001	6 MHz
3'b010	3 MHz
3'b011	1.5 MHz
3'b100	0.75 MHz
