### 2 Watts 2:1 Wide Input Range DC/DC Converters

Single Outputs

#### Key Features

- High Efficiency up to 80%
- 2:1 Input Range
- I/O Isolation 1000VDC
- Industry Standard Pinout
- SMT Technology
- Short Circuit Protection
- MTBF > 1,000,000 Hours
- External ON/OFF-Control
- Low Ripple and Noise

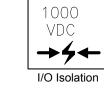

MCW1000-Series power modules are low-profile dc-dc converters that operate over input voltage ranges of 4.5-9VDC, 9-18VDC, 18-36VDC and 36-75VDC and provide precisely regulated output voltages of 3.3V, 5V, 12V.

The -40°C to +65°C operating temperature range makes it ideal for data communication equipments, mobile battery driven equipments, distributed power systems, telecommunication equipments, mixed analog/digital subsystems, process/machine control equipments, computer peripheral systems and industrial robot systems.

The modules have a maximum power rating of 2W and a typical full—load efficiency of 80%, continuous short circuit, 60mV output ripple, built—in filtering for both input and output minimizes the need for external filtering.

#### Absolute Maximum Ratings

| Parame                     | Min.               | Мах. | Unit           |     |
|----------------------------|--------------------|------|----------------|-----|
|                            | 5VDC Input Models  | -0.7 | 15             | VDC |
| Input Surge Voltage        | 12VDC Input Models | -0.7 | 25             | VDC |
| ( 1000 mS )                | 24VDC Input Models | -0.7 | 50             | VDC |
|                            | 48VDC Input Models | -0.7 | 100            | VDC |
| Lead Temperature (1.5mm    |                    | 260  | ${\mathscr C}$ |     |
| Internal Power Dissipation |                    |      | 1,800          | mW  |

Exceeding these values can damage the module. These are not continuous operating ratings.

#### **Environmental Specifications**

| Parameter             | Conditions          | Min.       | Мах. | Unit   |
|-----------------------|---------------------|------------|------|--|
| Operating Temperature | Ambient             | -40        | +65  | ${}^{\!$ |
| Operating Temperature | Case                | -40        | +90  | ${\mathscr C}$   |
| Storage Temperature   |                     | <i>−55</i> | +105 | ${\mathscr C}$   |
| Humidity              | 95                  |            | %    |  |
| Cooling               | Free-Air Convection |            |      |  |

#### Note:

- Specifications typical at Ta=+25°C, resistive load, nominal input voltage, rated output current unless otherwise noted.
- 2. Transient recovery time is measured to within 1% error band for a step change in output load of 50% to 100%
- 3. Ripple & Noise measurement bandwidth is 0-20 MHz.
- 4. These power converters require a minimum output loading to maintain specified regulation.
- 5. Operation under no-load conditions will not damage these devices; however they may not meet all listed specifications.
- 6. All DC/DC converters should be externally fused at the front end for protection.
- 7. Other input and output voltage may be available, please contact factory.
- 8. Specifications subject to change without notice.

### Input Specifications

| Parameter                      | Model            | Min. | Тур.   | Мах.      | Unit |

### Input Voltage Transient Rating

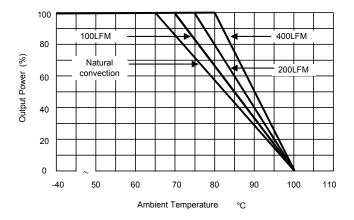

Efficiency vs Input Voltage ( Single Output )

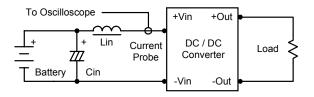

**Derating Curve** 

#### **Test Configurations**

#### Input Reflected-Ripple Current Test Setup

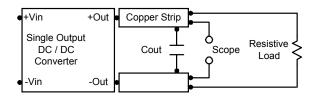

Input reflected—ripple current is measured with a inductor Lin (4.7uH) and Cin (220uF, ESR < 1.0 $\Omega$  at 100 KHz) to simulate source impedance.

Capacitor Cin, offsets possible battery impedance. Current ripple is measured at the input terminals of the module, measurement bandwidth is 0–500 KHz.

#### Peak-to-Peak Output Noise Measurement Test

Use a Cout 0.47uF ceramic capacitor.

Scope measurement should be made by using a BNC socket, measurement bandwidth is 0–20 MHz. Position the load between 50 mm and 75 mm from the DC/DC Converter.

#### Design & Feature Considerations

#### Maximum Capacitive Load

The MCW1000 series has limitation of maximum connected capacitance at the output.

The power module may be operated in current limiting mode during start—up, affecting the ramp—up and the startup time.

The maximum capacitance can be found in the data.

#### **Overcurrent Protection**

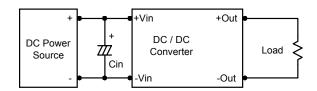

To provide protection in a fault (output overload) condition, the unit is equipped with internal current limiting circuitry and can endure current limiting for an unlimited duration. At the point of current–limit inception, the unit shifts from voltage control to current control. The unit operates normally once the output current is brought back into its specified range.

#### Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module.

In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup.

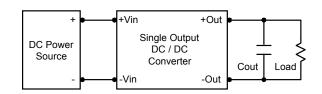

Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR < 1.0 $\Omega$  at 100 KHz) capacitor of a 8.2uF for the 5V input devices, a 3.3uF for the 12V input devices and a 1.5uF for the 24V and 48V devices.

#### **Output Ripple Reduction**

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance.

To reduce output ripple, it is recommended to use 3.3uF capacitors at the output.

#### Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 90°C.

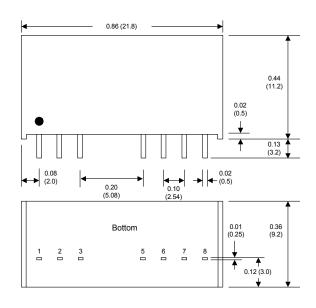

The derating curves are determined from measurements obtained in an experimental apparatus.
