## 5 Function Description

### 5.1 Registers

	A
	Y
	X
	P
PCH	PCL
1	S

### 5.2 Accumulator

The accumulator is a general-purpose 8-bit register, which stores the results of most arithmetic and logic operations. In addition, the accumulator usually contains one of two data words used in these operations.

### 5.3 Index Register(X,Y)

There are two 8-bit index registers (X and Y), which may be used to count program steps or to provide an index value to be used in generating an effective address. When executing an instruction, which specifies indexed addressing, the CPU fetches the OP Code and the base address, and modifies the address by adding the index register to it prior to performing the desired operation. Pre- or post-index of index address is possible.

### 5.4 Processor Status Register

The 8-bit processor status register contains seven status flags. Some of the flags are controlled by the program, others may be controlled both the program and the CPU.

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
N	V	1	B	D	I	Z	C

N: Signed flag, 1 = negative, 0 = positive

V: Overflow flag, 1 = true, 0 = false

B: BRK interrupt command, 1 = BRK, 0 = IRQB

D: Decimal mode, 1 = true, 0 = false

I: IRQB disable flag, 1 = disable, 0 = enable

Z: Zero flag, 1 = true, 0 = false

C: Carry flag, 1 = true, 0 = false

### 5.5 Program Counter(PC)

The 16-bit program counter register provides the addresses, which step the micro-controller through sequential program instructions. Each time the micro-controller fetch an instruction from program memory, the lower byte of the program counter (PCL) is placed on the low-order 8 bits of the address bus and the higher byte of the program counter (PCH) is placed on the high-order 8 bits. The counter is incremented each time an instruction or data is fetched from program memory.

### 5.6 Stack Point(S)

The stack pointer is an 8-bit register, which is used to control the addressing of the variable-length stack. The stack pointer is automatically incremented and decremented under control of the micro-controller to perform stack manipulations under direction of either the program or interrupts (/NMI or /IRQ). The stack allows simple implementation of nested subroutines and multiple level interrupts. The stack pointer is initialized by the user's firmware.

## 6 Memory Organization

There are 128 bytes SRAM, located in address 0000H to 007FH, in the MG65L513A. They could be used as either working RAM or stacks according to application programs. For the purpose above, the location 0000H to 007FH and 0100H to 017FH are overlaps. In other words, accessing any locations inside the range 0000H to 007FH is equivalent to access the corresponding ones in the range 0100 to 017FH. All special function registers, SFRs, are located at the region 00C0H to 00FFH. Such an arrangement could benefit from the faster access time of zero-page.

For LCD function, there are 16 bytes LCD RAM (1000H to 100FH) in MG65L513A. They can also be used as a general purpose RAM when LCD function is unused. There are 8K bytes program / data ROM in MG65L513A. The ROM address from E000H to FFFFH can store program and data. The address mapping of MG65L513A is shown as below.

**MG65L513A Memory Map**

Figure 6-1 Memory Map

## 6.1 SFR Mapping

The address 00C0H to 00FFH is reserved for special function registers (SFR). The SFR is used to control or store the status of I/O, timers, system clock and other peripheral.

※ All SFRs are not supported by bit-manipulation instructions.

## 6.2 Write Protect Function Register

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	R	W
00F9H	CWPR	PT7	PT6	PT5	PT4	PT3	PT2	PT1	PT0	-	✓

Condition Write Protect flag register (CWPR) is used to protect [IRQ\\_CLR.7 \(WDT\)](#), [PWR\\_CR.1 \(CKC0\)](#), [PWR\\_CR.2 \(CKC1\)](#), [SCK\\_SEL](#). If want to change [IRQ\\_CLR.7 \(WDT\)](#), [PWR\\_CR.1 \(CKC0\)](#), [PWR\\_CR.2 \(CKC1\)](#), [SCK\\_SEL](#), it must write “78H” to CWPR first.

PT7~PT0: Write Protect Pattern. In MG65L513A write protect pattern is “78H”

Note:

1. When CWPR is written by firmware, it would be automatically cleared by hardware after the “next write action” of firmware.

※ Bit-manipulation instructions are not available on this register.

## 7 Interrupt

There are five kinds interrupt source is provided in MG65L513A. The flag IRQ\_EN and IRQ\_ST are used to control the interrupts. When flag IRQ\_ST is set to '1' by hardware and the corresponding bits of flag IRQ\_EN has been set by software, an interrupt is generated. When an interrupt occurs, all of the interrupts are inhibited until the CLI or STA IRQ\_EN, # I instruction is invoked. Executing the SEI instruction can also disable the interrupts.

Table 7-1 Interrupt Vector Table

Vector Address	Item	Flag	Properties	Memo
FFFEH, FFFFH	P1 IRQ	IRQ_ST.1	Ext.	P1.0 ~ P1.4 interrupt vector
	P0 IRQ	IRQ_ST.2	Ext.	P0.0 ~ P0.7 interrupt vector
	TM0 IRQ	IRQ_ST.3	Int.	TM0 underflow interrupt
	TM1 IRQ	IRQ_ST.4	Int.	TM1 underflow interrupt
	DIV IRQ	IRQ_ST.5	Int.	Divider carry out interrupt

## 7.2 Interrupt System

Figure 7-1 Interrupt System Diagram

## 8 Reset

### 8.1 Low Voltage Reset (LVR)

The MG65L513A provides low voltage reset circuit in order to monitor the supply voltage of the device. If the supply voltage of the device is within the range 0.9V ~ VLVR, such as changing a battery, the LVR will automatically reset the device internally.

The LVR includes the following specifications

1. The low voltage (0.9V~VLVR) has to remain in their original state to exceed 1ms. If the low voltage state does not exceed 1ms, the LVR will ignore it and do not perform a reset function.
2. In the LVR mode, the clock source (INT./EXT. OSC) continuous oscillating and the IO status becomes default value.

### 8.2 Watchdog Timer (WDT)

(The example is base on 32.768KHz and SCK\_SEL.1 = 1)

Name								Bit 8	R	W
WDT								1.9 (Hz)	-	-

The watchdog timer time-out period is obtained by the equation:  $(F_{DIV} / 512)/512$  or  $(F_{DIV} / 4096)/512$  select by SCK\_SEL.1 (CKS1).

Before watchdog timer time-out occurs, the program must clear the 9-bit WDT timer by writing 1 to IRQ\_CLR.7. WDT overflow will cause system reset and set IRQ\_CLR.7 to high.

Figure 8-1 Watch Dog Diagram

### 8.3 Reset OK

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	R	W
00C5H	RESOK	RK7	RK6	RK5	RK4	-	-	-	IO_RES	-	✓

RESOK (Reset OK): If the device reset OK and work well, **must** write #\$90 into this register.

For example:

```
Program_start:      LDA    #10010000b
                    STA    $C5
```

IO\_RES: IO reset selector.

0:IO status is reset by WDT, IA reset, LVR and POR, EXT\_RESET (Default).

1:IO status is reset by LVR, EXT\_RESET and POR.

## 9 Power Control

### 9.1 Power Control Register

#### Power saving control

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	R	W
00FCH	PWR_CR	-	-	-	-	-	CKC1	CKC0	HALT	-	✓

※ CKC1 and CKC0 are protected by CWPR

CKC1	CKC0	System clock control
0	0	$F_{osc}$ enable, $F_{X32}$ enable (Dual mode)
0	1	$F_{osc}$ enable, $F_{X32}$ disable (Single mode)
1	0	$F_{osc}$ disable, $F_{X32}$ enable (Slow mode)
1	1	$F_{osc}$ disable, $F_{X32}$ disable (Stop mode)

Note: Dual mode and slow mode is inhibited when code option is selected to  $F_{X32}$  disable.

HALT:  $F_{CPU}$  off-line control bit. 1:  $F_{CPU}$  off-line, 0:  $F_{CPU}$  on-line

Program can switch the normal operation mode to the power-saving mode for saving power consumption through this register. There are three power saving modes in this system.

*Slow mode: (PWR\_CR.ckc1 = 1, PWR\_CR.ckc0 = 0)*

The main uC clock ( $F_{osc}$ ) stops oscillating. Only very low power is needed for uC to keep running.

*Stop mode: (PWR\_CR.ckc1 = 1, PWR\_CR.ckc0 = 1)*

Both system clocks stop oscillating. The uC can be awakened from stop mode by 4-ways: port 0 falling edge, port 1 falling edge, hardware reset, or power-on reset. When the stop mode is released, only the oscillator, which is providing the uC clock, will be enabled again.

If uC clock source is  $F_{X32}$  and system into STOP mode (set PWR\_CR[2:1] = 11). The  $F_{X32}$  will be enabled and  $F_{osc}$  still keep same status, when uC waken up by port0 or port1.

*Halt mode: (PWR\_CR.HALT = 1)*

The  $F_{CPU}$  clock in off-line status. The oscillator(s) still keep same status. The uC can be awakened from halt mode by 3-ways: the interrupt events, hardware reset, or power-on reset.

Port 0 is combined with 4-bit input port and 4-bit I/O port. P0.7~P0.4 can be programmed as input or output individually. When P0.n (n= 4~7) is configured as an output pin, the P0.n pin would output the logic content of internal P0obuf.n (P0 output buffer). The default value of P0obuf is 0000----b.

When the P0.n is configured as output mode, reading P0.n would always read logic '0'.

When the P0.n is configured as input mode, reading P0.n would always read the logic value from pad.

0: Disable internal pull-high

PHn: Control bit is used to enable the pull-high of P1.n pin.

※ Bit-manipulation instructions are not available on this register.

## 12.3 Port 2

## 12.4 High sink output

### HSO Buffer

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	R	W
00DAH	HSOB	HSO	-	-	-	-	-	-	PS0	-	✓

HSO pad is a high sink current output pin. The HSO PAD output from HSOB or Tone is selected by PS0.

HSOB. 7 can set up 1/3 or 2/3 duty cycle by using instruction, writer "1", through HSO buffer to PAD output High, until writer "0", and then the output status will change to Low.

※ Bit-manipulation instructions are not available on this register.

PS0 (HSOB.0) can set the HSO pad output source as HSO buffer or tone generator. The HSO output waveform can be programmed to any duty cycle by software.

If the tone path is selected (PS0=1), the duty cycle of the carrier output is fixed to 50%.

The counter underflow frequency of timer0 can be calculated with the equation:

$$F_{TM0\_UV} = F_{TM0} / (TM0reg+1). \text{ The } F_{TM0} \text{ is Timer0 clock input.}$$

For example:  $F_{TM0} = 455\text{KHz}$ ,  $TM0reg = 0BH$

$$F_{TM0\_UV} = F_{TM0} / (TM0reg+1) = 455K/(0BH+1) = 37.92\text{KHz.}$$

## 13 LCD Controller/Driver

The MG65L513A can directly drive an LCD with 29 segment output pins and 4 common output pins for a total of 29 × 4 dots. LCD control register can be used to select LCD display configuration. LCD driving mode is 1/3 bias and 1/4 duty and frame frequency is about 81.38Hz. When CPU access the LCD RAM area, the access path of the LCD RAM will be transferred from LCD driver to CPU automatically.
