

MK2771-13 VCXO and Set-Top Clock Source

Description

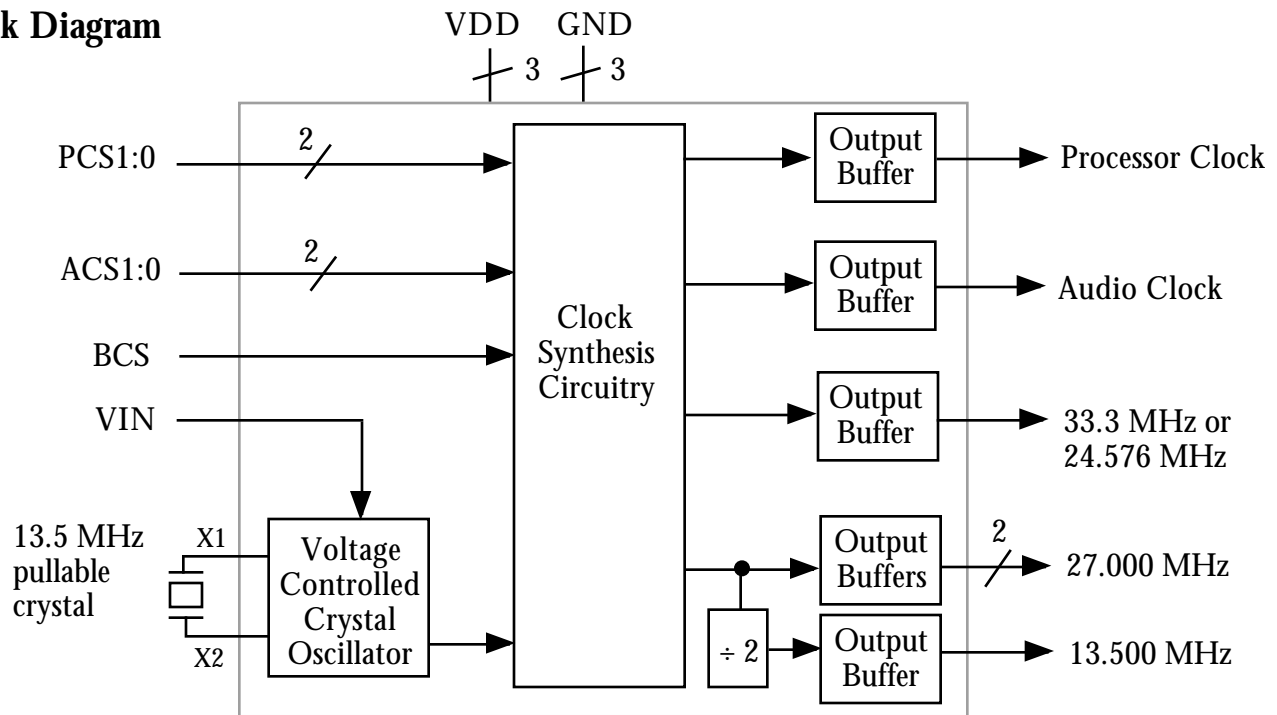

The MK2771-03 is a low cost, low jitter, high performance VCXO and clock synthesizer designed for set-top boxes. The on-chip Voltage Controlled Crystal Oscillator accepts a 0 to 3V input voltage to cause the output clocks to vary by ± 100 ppm. Using ICS/MicroClock's patented VCXO and analog Phase-Locked Loop (PLL) techniques, the device uses an inexpensive 13.5 MHz crystal input to produce multiple output clocks including a selectable processor clock, a selectable audio clock, a fixed 33.33 MHz or 24.576 MHz, two low skew copies of the 27MHz, and a fixed 13.5 MHz. All clocks are frequency locked to the 27.00MHz output (and to each other) with zero ppm error, so any output can be used as the VCXO output.

This chip directly replaces the MK2771-03 when a 13.5 MHz input crystal is substituted for the 14.31818 MHz used on the -03. Additionally, the -13 adds 25 MHz to the processor clock selection, and 24.576 MHz on the BCLK.

External Components

The MK2771-13 requires a minimum number of external components for proper operation. Decoupling capacitors of 0.1µF should be connected between VDD and GND on pins 4 and 7, 6 and 7, and 15 and 14, as close to the MK2771-13 as possible. A series termination resistor of 33 Ω may be used for each clock output. The 13.500 MHz crystal must be connected as close to the chip as possible. The crystal should be a parallel mode, pullable, with load capacitance of 14pF. Consult MicroClock for recommended suppliers. See MAN05 for recommended layout of the chip and external components.
