MP7611

Octal 14-Bit DAC Array™ D/A Converter with Output Amplifier and Parallel Data/Address μP Control Logic

June 1998-3

FEATURES

- Eight Independent Channel 14-Bit DACs with Output Amplifiers
- Low Power 320 mW (typ.)
- Parallel Digital Data and Address Port
- Double Buffered Data Interface
- Readback of DAC Latches
- Zero Volt Output Preset (Data = 10 .. 00)
- 14-Bit Resolution, 12-Bit Accuracy
- Extremely Well Matched DACs
- Extremely Low Analog Ground Current (<60μA/Channel)
- ±10 V Output Swing with ±11.4 V Supplies
- Rugged Construction – Latch-Up Free
- Serial Version: MP7610

APPLICATIONS

- Data Acquisition Systems
- ATE
- Process Control
- Self-Diagnostic Systems
- Logic Analyzers
- Digital Storage Scopes
- PC Based Controller/DAS

GENERAL DESCRIPTION

The MP7611 provides eight independent 14-bit resolution Digital-to-Analog Converters with voltage output amplifiers and a parallel digital address and data port.

Built using an advanced linear BiCMOS, these devices offer rugged solutions that are latch-up free, and take advantage of EXAR s patented thin-film resistor process which exhibits excellent long term stability and reliability.

A standard μ-processor and TTL/CMOS compatible 14-bit input data port loads the data into the pre-selected DACS.

This device can easily be interfaced to a data bus, and digital readback of each channel is available.

Typical DAC matching for C grade versions is 1.5 LSB across all codes. The output amplifier is capable of sinking and sourcing 5mA, and the output voltage settles to 12-bits in less than 30μs (typ.).

ORDERING INFORMATION

Package Type	Temperature Range	Part No.	Res. (Bits)	INL (LSB)	DNL (LSB)	FSE (LSB)
PQFP	0 to +70°C	MP7611CE	14	±2	±2	±16

PIN OUT DEFINITIONS

PLCC PIN NO.	PQFP PIN NO.	NAME	DESCRIPTION
29	1	N/C	No Connection
30	2	VO3	DAC 3 Output
31	3	V_{EE}	Analog Negative Power Supply (–12 V)
32	4	V_{CC}	Analog Positive Power Supply (+12 V)
33	5	N/C	No Connection or DV_{DD}
34	6	V_{REF}	Analog Voltage Reference Input (+5 V)
35	7	V_{REFN}	Analog Negative Voltage Reference Output (–2.5 V)
36	8	V_{CC}	Analog Positive Power Supply (+12 V)
37	9	V_{EE}	Analog Negative Power Supply (–12 V)
38	10	VO4	DAC 4 Output
39	11	N/C	No Connection
40	12	VO5	DAC 5 Output
41	13	VO6	DAC 6 Output
42	14	VO7	DAC 7 Output
43	15	AGND	Analog Ground (0 V)
44	16	$\overline{CS}$	Chip Select Enable
1	17	$\overline{RD}$	Read Back Enable
2	18	$\overline{R2}$	Second–Latch-Bank Reset Enable
3	19	$\overline{R1}$	First–Latch-Bank Reset Enable
4	20	$\overline{LD2}$	Second–Latch-Bank Load Enable
5	21	$\overline{LD1}$	First–Latch-Bank Load Enable
6	22	A2	Digital Address Bit 2
7	23	A1	Digital Address Bit 1
8	24	A0	Digital Address Bit 0
9	25	DB0	Digital Input Data Bit 0
10	26	DB1	Digital Input Data Bit 1
11	27	DB2	Digital Input Data Bit 2
12	28	DB3	Digital Input Data Bit 3
13	29	DB4	Digital Input Data Bit 4
14	30	DB5	Digital Input Data Bit 5
15	31	DB6	Digital Input Data Bit 6
16	32	DB7	Digital Input Data Bit 7
17	33	DB8	Digital Input Data Bit 8
18	34	DB9	Digital Input Data Bit 9
19	35	DB10	Digital Input Data Bit 10
20	36	DB11	Digital Input Data Bit 11
21	37	DB12	Digital Input Data Bit 12
22	38	DB13	Digital Input Data Bit 13 (MSB)
23	39	DV_{DD}	Digital Positive Power Supply (+5 V)
24	40	DGND	Digital Ground (0 V)
25	41	AGND	Analog Ground (0 V)
26	42	VO0	DAC 0 Output
27	43	VO1	DAC 1 Output
28	44	VO2	DAC 2 Output

ELECTRICAL CHARACTERISTICS

V_{CC} = +12 V, V_{EE} = −12 V, V_{REF} = 5 V, DV_{DD} = 5.0 V, T = 25°C, Output Load = 5kΩ (unless otherwise noted)

$\overline{R2}$ Pulse Width	t_{R2W}	100					ns	

NOTES:

1 Guaranteed; not tested.

2 Specified values guarantee functionality.

3 Digital inputs should not go below digital GND or exceed DV_{DD} supply voltage.

4 *See Figures 1, 2 and 3*. All digital input signals are specified with $t_R = t_F = 10$ ns 10% to 90% and timed from a 50% voltage level.

5 For power supply values < $\pm 2 * V_{REF}$, the output swing is limited as specified in Analog Outputs.

6 Digital feedthrough and channel-to-channel crosstalk are heavily dependent on the board layout and environment.

Specifications are subject to change without notice

ABSOLUTE MAXIMUM RATINGS (TA = +25°C unless otherwise noted)[1, 2]

V_{CC} to AGND ..... +16.5 V
V_{EE} to AGND ..... −16.5 V
DV_{DD} to DGND ..... +6.5 V
VREF to DGND ..... +7.0 V
Analog Outputs & Inputs
Infinite Shorts to V_{CC}, V_{EE}, DV_{DD}, AGND and DGND (provided that power dissipation of the package spec is not exceeded)
AGND to DGND ..... ±1 V
(Functionality guaranteed for ±0.5 V only)
Digital Input & Digital Output Voltage to:
DV_{DD} ..... +.5 V
DGND ..... −.5 V
Operating Temperature Range
Extended Industrial ..... −40°C to +85°C
Military ..... −55°C to +125°C
Maximum Junction Temperature ..... 150°C
Storage Temperature Range ..... −65°C to +150°C
Lead Temperature (Soldering, 10 sec) ..... +300°C
Package Power Dissipation Rating to 75°C
PQFP, PGA, PLCC 800mW
Derates above 75°C ..... 11mW/°C

NOTES:

1 Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation at or above this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2 Any input pin which can see a value outside the absolute maximum ratings should be protected by Schottky diode clamps (HP5082-2835) from input pin to the supplies. *All inputs have protection diodes* which will protect the device from short transients outside the supplies of less than 100mA for less than 100µs.

APPLICATION NOTES

NOTE: When using these DACs to drive remote devices, the accuracy of the output can be improved by utilizing a remote analog ground connection. The difference between the DGND and AGND should be limited to ±300 mV to assure normal operation. If there is any chance that the AGND to DGND can be greater than ±1 V, we recommend two back-to-back diodes be used between DGND and AGND to clamp the voltage and prevent damage to the DAC. Using a buffer between the remote ground location and AGND may help reduce noise induced from long lead or trace lengths.

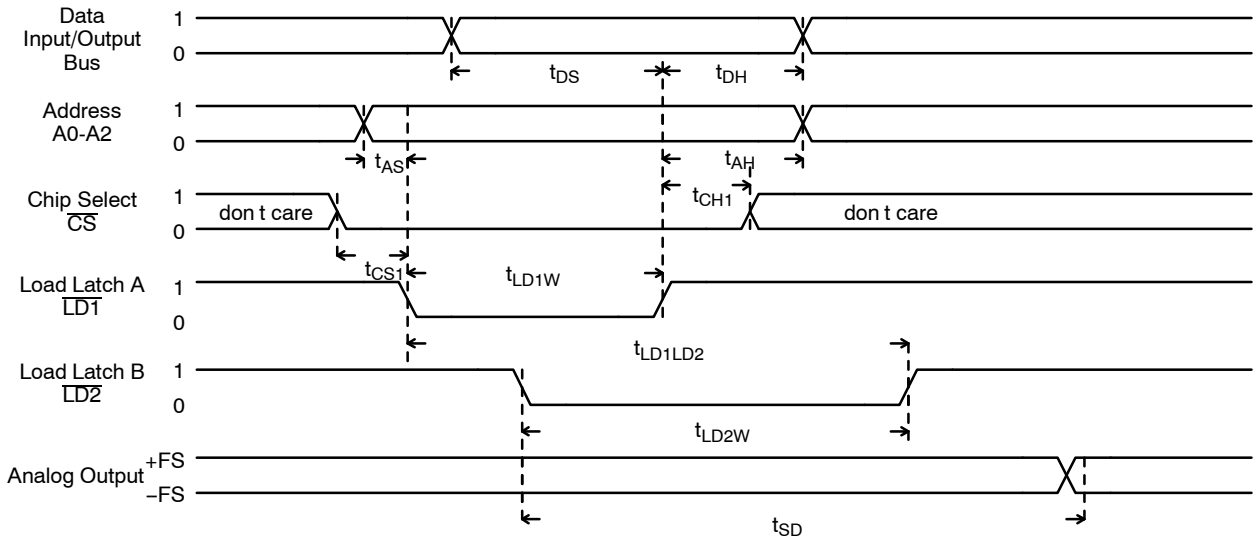

Figure 1. Loading Latch A and Updating Latch B

Notes:
(1) Chip Select ($\overline{CS}$) and Load LATCHA ($\overline{LD1}$) Signals follow the same timing constraints and are interchangeable in the above diagram.
(2) $\overline{R1}$ = $\overline{R2}$ = 1.
(3) For the case where $\overline{LD2}$ is in the low state, analog output would respond to the falling edge of $\overline{LD1}$ (transparent mode).

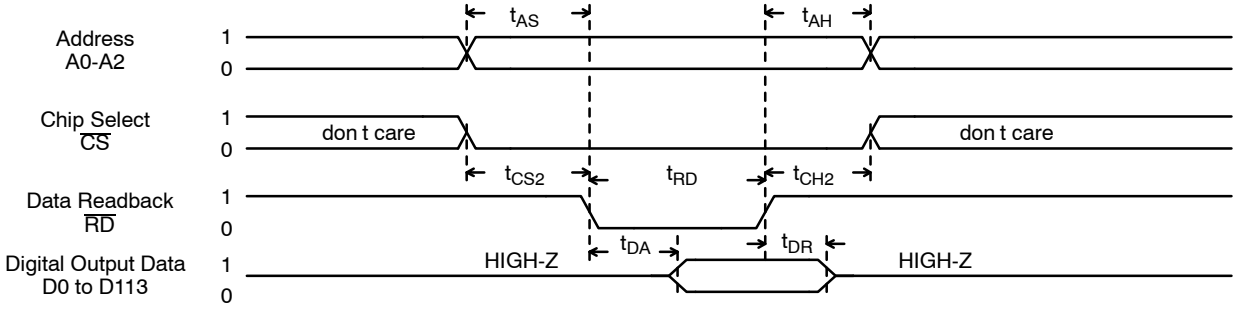

Figure 2. Read Back First Latch Bank of One DAC

Notes:
(1) Chip Select ($\overline{CS}$) and Data Readback ($\overline{RD}$) Signals follow the same timing constraints and are interchangeable in the above diagram.
(2) $\overline{R1}$ = $\overline{R2}$ = 1.

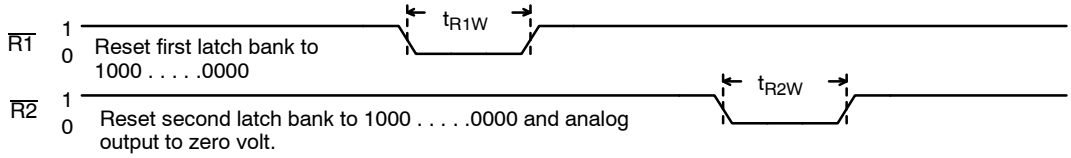

Figure 3. Reset Operations

A standard μ-processor and TTL/CMOS compatible input data port loads the data into the pre-selected DACS. If $\overline{CS}$ = 0, the chip accesses digital data on the bus. Then address bits A0 to A2 select the appropriate DAC and $\overline{LD1}$ loads the data into the first-latch-bank. When all 8-channels first-latch-banks are loaded, then $\overline{LD2}$ enables the second-latch-bank and updates all 8-channels simultaneously. The selected DAC becomes transparent (activity on the digital inputs appear at the analog output) when both $\overline{LD1}$ = $\overline{LD2}$ = 0.

$\overline{R1}$ = 0 resets the first-latch-bank. $\overline{R2}$ = 0 resets the second-latch-bank which sets the analog output to zero volts (data = 100...00), regardless of digital inputs.

Function	A2	A1	A0	$\overline{RD}$	$\overline{LD1}$	$\overline{LD2}$	$\overline{CS}$	$\overline{R1}$	$\overline{R2}$
Load Latch 1 of DAC1	0	0	0	1	0→1	1	0	1	1
