

DESCRIPTION

The MPQ1925 is a high-frequency, N-channel MOSFET, half-bridge gate driver. The device's low-side MOSFET (LS-FET) and high-side MOSFET (HS-FET) driver channels are independently controlled, and are matched with less than 5ns in time delay. In the case of an insufficient supply, the device's HS-FET and LS-FET under-voltage lockout (UVLO) protection forces the outputs low. The MPQ1925 also features an integrated bootstrap (BST) diode to reduce the external component count.

The MPQ1925 is available in a QFN-8 (4mmx4mm) package.

FEATURES

- Drives an N-Channel MOSFET Half-Bridge
- 115V Bootstrap Voltage (V_{BST}) Range
- On-Chip Bootstrap (BST) Diode
- Typical 20ns Propagation Delay
- <5ns Gate Driver Matching Time
- Drives a 2.2nF Load with a 15ns Rise Time and 10ns Fall Time at 12V V_{DD}
- Transistor-to-Transistor Logic (TTL)-Compatible Input
- <150 μ A Quiescent Current (I_Q)
- High-Side MOSFET (HS-FET) and Low-Side MOSFET (LS-FET) Under-Voltage Lockout (UVLO) Protection
- Available in a QFN-8 (4mmx4mm) Package

APPLICATIONS

- Motor Drivers
- Telecommunication Half-Bridge Power Supplies
- Avionics DC/DC Converters
- Two-Switch Forward Converters
- Active-Clamp Forward Converters

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

PACKAGE REFERENCE

PIN FUNCTIONS

Pin #	Name	Description
1	VDD	Supply input. The VDD pin supplies power to the internal circuitry. Place a decoupling capacitor to ground, close to VDD, to ensure a stable and clean supply.
2	BST	Bootstrap. The BST pin is the positive power supply for the internal, high-side MOSFET (HS-FET) floating driver. Connect a bypass capacitor between the BST and SW pins.
3	DRVH	Floating driver output.
4	SW	Switching node.
5	INH	Floating driver control signal input.
6	INL	Low-side (LS) driver control signal input.
7	VSS, exposed pad	Chip ground. Connect the VSS pin to the exposed pad for proper thermal operation.
8	DRVL	LS driver output.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

Supply voltage (V_{DD})	-0.3V to +18V
SW voltage (V_{SW})	-5V to +105V
SW voltage (V_{SW})	-25V (<100ns) to +105V
BST voltage (V_{BST})	-0.3V to +115V
BST voltage (V_{BST})	-15V (<100ns) to +115V
BST to SW	-0.3V to +18V
DRVH to SW ⁽²⁾	-0.3V to +18.3V
DRVH to SW ⁽²⁾	-5V (<100ns) to +18.3V
DRVH to VSS	-0.3V to (BST - VSS) + 0.3V
DRVH to VSS	-15V (<100ns) to (BST - VSS) + 0.3V
DRVL to VSS ⁽²⁾	-0.3V to +18.3V
DRVL to VSS ⁽²⁾	-5V (<100ns) to +18.3V
INH/INL to VSS	-0.3V to (VDD + 0.3V)
INH/INL to VSS	-5V (<100ns) to (VDD + 0.3V)
All other pins	-0.3V to (VDD + 0.3V)
Continuous power dissipation ($T_A = 25^\circ\text{C}$) ⁽³⁾	
QFN-8 (4mmx4mm)	2.66W
Junction temperature	150°C
Lead temperature	260°C
Storage temperature	-65°C to +150°C

ESD Ratings

Human body model (HBM)	$\pm 1.5\text{kV}$
Charged device model (CDM)	$\pm 750\text{V}$

Recommended Operating Conditions ⁽⁴⁾

Supply voltage (V_{DD})	8V to 15V
SW voltage (V_{SW})	-1V to +100V
SW slew rate	<50V/ns
Operating junction temp ($T_J = T_A$)	
	-40°C to +150°C

Thermal Resistance ⁽⁵⁾ θ_{JA} θ_{JC}

QFN-8 (4mmx4mm)	47	7	$^\circ\text{C/W}$
-----------------	----	---	--------------------

Notes:

- Exceeding these ratings may damage the device. The repetitive pulse rating is guaranteed for a period of $\leq 100\text{ns}$ with a 100kHz maximum repetition rate when V_{DD} is $\leq 15\text{V}$.
- DRVH and DRVL are outputs pins that cannot be connected to the external supply voltage.
- The maximum allowable power dissipation is a function of the maximum junction temperature, T_J (MAX), the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A . The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = $(T_J$ (MAX) - T_A) / θ_{JA} . Exceeding the maximum allowable power dissipation can produce an excessive die temperature, which may cause the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- The device is not guaranteed to function outside of its operating conditions.
- Measured on JESD51-7, 4-layer PCB.

ELECTRICAL CHARACTERISTICS

$V_{DD} = V_{BST} - V_{SW} = 12V$, $V_{SS} = V_{SW} = 0V$, no load at DRVH and DRVL, $T_J = -40^{\circ}C$ to $+150^{\circ}C$, typical value is tested at $T_J = 25^{\circ}C$, unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units
Supply Current						
VDD quiescent current (I_Q)	I_{DDQ}	INL = INH = 0		110	150	μA
VDD operating current	I_{DDO}	$f_{SW} = 500kHz$		7	12	mA
Floating driver I_Q	I_{BSTQ}	INL = INH = 0		60	90	μA

REFERENCE DESIGN CIRCUITS

Half-Bridge Converter

In a half-bridge converter topology, the high-side MOSFET (HS-FET) and low-side MOSFET (LS-FET) are driven alternately with a dead time (DT) inserted between their respective on periods. INT and INL are driven with alternating signals via the pulse-width modulation (PWM) controller. The input voltage (V_{IN}) can rise up to 100V when in a half-bridge topology (see Figure 5 in the Typical Application Circuits section on page 13).

Two-Switch Forward Converter

In a two-switch forward converter topology, the HS-FET and LS-FET start up and shutdown simultaneously. During current-mode control, the INH and INL input signals sense the output voltage (V_{OUT}) and output current (I_{OUT}) via a PWM controller.

The Schottky diodes clamp the power transformer's reverse swing, and must be rated for V_{IN} , which can rise up to 100V (see Figure 6 in the Typical Application Circuits section on page 13).

Active-Clamp Forward Converter

In an active-clamp forward converter topology, the HS-FET and LS-FET are driven alternately. The HS-FET and reset capacitor (C_{RESET}) reset the power transformer without loss.

Active-clamp forward converter topologies are optimal for duty cycles exceeding 50%. The MPQ1925 may not be able to operate at 100V in an active-clamp forward topology (see Figure 7 in the Typical Application Circuits section on page 13).

APPLICATION INFORMATION

The INH and INL input signals can be controlled independently. If both INH and INL control the HS-FET and LS-FET of the same bridge, set a sufficient DT between the low INH and low INL signals (and vice versa) to avoid shoot-through.

DT is the time interval between low INH and low INL. Figure 3 shows the shoot-through timing diagram.

Figure 3: Shoot-Through Timing Diagram

PCB Layout Guidelines

Proper PCB layout is critical for the optimal performance of the HS-FET and LS-FET gate drivers. The MPQ1925 is designed to accommodate negative undershoot; however, excessive undershoot can lead to unpredictable operation or damage to the IC. For the best results, refer to Figure 4 and follow the guidelines below:

1. Make the connection between the HS-FET source and the LS-FET drain as direct as possible to avoid a negative undershoot on the phase node due to parasitic inductance.
2. Use surface-mount N-channel MOSFETs that allow for a very short connection between the HS-FETs and LS-FETs.
3. Place the bootstrap capacitor (C3) and supply bypass capacitor (C2) as close as possible to the IC.
4. Use multiple vias to connect the ground side of these capacitors, which are connected to

a solid ground plane, to both the GND pin and exposed pad.

5. Keep the high-current ground path between the input supply, input bulk capacitor (C6), and the MOSFETs away from the IC.
