

MSP430FG662x, MSP430FG642x Mixed-Signal Microcontrollers

1 Device Overview

1.1 Features

- Low Supply Voltage Range:
3.6 V Down to 1.8 V
- Ultra-Low Power Consumption
 - Active Mode (AM):
All System Clocks Active:
250 μ A/MHz at 8 MHz, 3.0 V, Flash Program Execution (Typical)
 - Standby Mode (LPM3):
Watchdog With Crystal, and Supply Supervisor Operational, Full RAM Retention, Fast Wakeup:
3.2 μ A at 2.2 V, 3.4 μ A at 3.0 V (Typical)
 - Shutdown RTC Mode (LPM3.5):
Shutdown Mode, Active Real-Time Clock With Crystal:
0.9 μ A at 3.0 V (Typical)
 - Shutdown Mode (LPM4.5):
0.2 μ A at 3.0 V (Typical)
- Wake up From Standby Mode in 3 μ s (Typical)
- 16-Bit RISC Architecture, Extended Memory, up to 20-MHz System Clock
- Flexible Power-Management System
 - Fully Integrated LDO With Programmable Regulated Core Supply Voltage
 - Supply Voltage Supervision, Monitoring, and Brownout
- Unified Clock System
 - FLL Control Loop for Frequency Stabilization
 - Low-Power Low-Frequency Internal Clock Source (VLO)
 - Low-Frequency Trimmed Internal Reference Source (REFO)
 - 32-kHz Crystals (XT1)
 - High-Frequency Crystals up to 32 MHz (XT2)
- Four 16-Bit Timers With 3, 5, or 7 Capture/Compare Registers
- Two Universal Serial Communication Interfaces
 - USCI_A0 and USCI_A1 Each Support
 - Enhanced UART With Automatic Baud-Rate Detection
 - IrDA Encoder and Decoder
 - Synchronous SPI
 - USCI_B0 and USCI_B1 Each Support
 - I²C
 - Synchronous SPI
- Full-Speed Universal Serial Bus (USB)
 - Integrated USB-PHY
 - Integrated 3.3-V and 1.8-V USB Power System
 - Integrated USB-PLL
 - Eight Input and Eight Output Endpoints
- Continuous-Time Sigma-Delta 16-Bit Analog-to-Digital Converter (ADC) With Internal Reference With 10 External Analog Inputs, 6 Single-Ended and 4 Selectable as Differential or Single-Ended
- Dual Low-Power Operational Amplifiers
- Quad Low-Impedance Ground Switches
- Dual 12-Bit Digital-to-Analog Converters (DACs) With Synchronization
- Voltage Comparator
- Integrated LCD Driver With Contrast Control for up to 160 Segments
- Hardware Multiplier Supports 32-Bit Operations
- Serial Onboard Programming, No External Programming Voltage Needed
- Six-Channel Internal DMA
- Real-Time Clock (RTC) Module With Supply Voltage Backup Switch
- [Device Comparison](#) Summarizes Family Members

1.2 Applications

- Analog Sensor Systems
- Digital Sensor Systems
- Hand-Held Meters
- Medical Diagnostic Meters
- Hand-Held Industrial Testers
- Measurement Equipment

1.3 Description

The TI MSP family of ultra-low-power microcontrollers consists of several devices featuring different sets of peripherals targeted for various applications. The architecture, combined with five low-power modes, is optimized to achieve extended battery life in portable measurement applications. The device features a powerful 16-bit RISC CPU, 16-bit registers, and constant generators that contribute to maximum code efficiency. The digitally controlled oscillator (DCO) allows the device to wake up from low-power modes to active mode in 3 μ s (typical).

The MSP430FG6626 and MSP430FG6625 are microcontrollers with a high-performance 16-bit analog-to-digital converter (ADC), dual 12-bit digital-to-analog converters (DACs), dual operational amplifiers, a comparator, two universal serial communication interfaces (USCIs), USB 2.0, a hardware multiplier, DMA, four 16-bit timers, a real-time clock (RTC) module with alarm capabilities, an LCD driver, and up to 73 I/O pins.

The MSP430FG6426 and MSP430FG6425 are microcontrollers with a high-performance 16-bit ADC, dual 12-bit DACs, dual low-power operational amplifiers, a comparator, two USCIs, a 3.3-V LDO, a hardware multiplier, DMA, four 16-bit timers, an RTC module with alarm capabilities, an LCD driver, and up to 73 I/O pins.

Typical applications for these devices include analog and digital sensor systems, hand-held meters, such as medical diagnostic meters, measurement equipment, and hand-held industrial testers.

For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

2 Revision History

Changes from May 23, 2015 to September 26, 2018	Page
• Added Section 3.1, Related Products	7
• Added typical conditions statements at the beginning of Section 5, Specifications	27
• Updated notes (1) and (2) and added note (3) in Table 5-8, Wake-up Times From Low-Power Modes and Reset ..	37
• Removed duplicate symbol and removed note (5) on $R_{i(V_{REFB})}$, $R_{i(V_{REF+})}$ parameter in Table 5-40, 12-Bit DAC, Reference Input Specifications	62
• Added "CBPWRMD = 00 or 01" to Test Conditions of the first row of the t_{EN_CMP} parameter; Added second row for t_{EN_CMP} with Test Conditions of "CBPWRMD = 10" and MAX value of 100 μ s in Table 5-47, Comparator_B	68
• Added Section 5.8.18, LDO-PWR (LDO Power System)	71
• Throughout document, changed all instances of "bootstrap loader" to "bootloader"	82
• Changed decoupling capacitor recommendation from "one 10 μ F and one 100 nF" to "one 1 μ F and one 100 nF" for consistency with Section 7.1.1	155
• Changed decoupling capacitor recommendation from "one 10 μ F and one 100 nF" to "one 1 μ F and one 100 nF" for consistency with Section 7.1.1	156
• Changed decoupling capacitor recommendation from "one 10 μ F and one 100 nF" to "one 1 μ F and one 100 nF" for consistency with Section 7.1.1	159
• Added Section 7.2.5, DAC12 Peripheral	163
• Added Section 7.2.6, USB Module	164
• Added Section 7.2.7, LDO Module	165
• Replaced former section <i>Development Tools Support</i> with Section 8.3, Tools and Software	168
• Changed format and added content to Section 8.4, Documentation Support	170

- (1) For the most current package and ordering information, see the *Package Option Addendum* in Section 9, or see the TI website at www.ti.com.
- (2) Package drawings, standard packing quantities, thermal data, symbolization, and PCB design guidelines are available at www.ti.com/packaging.
- (3) The additional 2KB of USB SRAM that is listed can be used as general-purpose SRAM when USB is not in use.
- (4) Each number in the sequence represents an instantiation of Timer_A with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_A, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
- (5) Each number in the sequence represents an instantiation of Timer_B with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_B, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
- (6) ADC inputs consist of a mix of single ended and differential. See the pinning for available input pairs and types.

(1) For each multiplexed pin, the signal that is listed first in this table is the reset default.

(2) To determine the pin mux encodings for each pin, refer to [Section 6.13, Input/Output Schematics](#).

(3) Signal Types: I = Input, O = Output, I/O = Input or Output, P = power

(4) Buffer Types: LVC MOS, HVCMOS, Analog, or Power (see [Table 4-3](#) for details).

(5) The power source shown in this table is the I/O power source, which may differ from the module power source.

(6) Reset States:

OFF = High-impedance input with pullup or pulldown disabled (if available)

HiZ = High-impedance (neither input nor output)

PD = High-impedance input with pulldown enabled

PU = High-impedance input with pullup enabled

DRIVE0 = Drive output low

DRIVE1 = Drive output high

N/A = Not applicable

(7) For Debug pins: Emu = with emulator attached at reset, No Emu = without emulator attached at reset

4.4 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see [Section 6.13](#).

4.5 Buffer Type

[Table 4-3](#) describes the buffer types that are referenced in [Table 4-1](#).

Table 4-3. Buffer Type

(1) This is a switch, not a buffer.

(2) Only for input pins

(3) This is supply input, not a buffer.

4.6 Connection of Unused Pins

Table 4-4 lists the correct termination of all unused pins.

Table 4-4. Connection of Unused Pins⁽¹⁾

PIN	POTENTIAL	COMMENT
AVCC	DV _{CC}	
AVSS	DV _{SS}	
CPCAP	Open	For devices where the charge pump is not used (no rail-to-rail OA and no rail-to-rail CTSD16).
LCDCAP	DV _{SS}	
LDO1	DV _{SS}	For devices with LDO-PWR module when not being used in the application.
LDO0	Open	For devices with LDO-PWR module when not being used in the application.
NC	Open	
PJ.0/TDO PJ.1/TDI PJ.2/TMS PJ.3/TCK	Open	The JTAG pins are shared with general-purpose I/O function (PJ.x). If not being used, these must be switched to port function, output direction (PJDIR.n = 1). When used as JTAG pins, these pins must remain open.
PU.0/DP PU.1/DM	Open	For USB devices only when USB module is not being used in the application
PUR ⁽²⁾	DV _{SS}	For USB devices only when USB module is not being used in the application
Px.y	Open	Switched to port function, output direction (PxDIR.n = 1). Px.y represents port x and bit y of port x (for example, P1.0, P1.1, P2.2, PJ.0, PJ.1)
RST/NMI	DV _{CC} or V _{CC}	47-kΩ pullup or internal pullup selected with 10-nF (2.2 nF) pulldown ⁽³⁾
Reserved	DV _{SS}	
TEST	Open	This pin always has an internal pulldown enabled.
V18	Open	For USB devices only when USB module is not being used in the application
VBAK	Open	For devices where no separate battery backup supply is used in the system. Set bit BAKDIS = 1.
VBAT	DV _{CC}	For devices where no separate battery backup supply is used in the system. Set bit BAKDIS = 1.
VBUS, VSSU	DV _{SS}	For USB devices only when USB module is not being used in the application
VUSB	Open	For USB devices only when USB module is not being used in the application
XIN	DV _{SS}	For dedicated XIN pins only. XIN pins with shared GPIO functions must be programmed to GPIO and follow Px.y recommendations.
XOUT	Open	For dedicated XOUT pins only. XOUT pins with shared GPIO functions must be programmed to GPIO and follow Px.y recommendations.
XT2IN	DV _{SS}	For dedicated XT2IN pins only. XT2IN pins with shared GPIO functions must be programmed to GPIO and follow Px.y recommendations.
XT2OUT	Open	For dedicated XT2OUT pins only. XT2OUT pins with shared GPIO functions must be programmed to GPIO and follow Px.y recommendations.

- (1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.y unused pin connection guidelines.
- (2) The default USB BSL evaluates the state of the PUR pin after a BOR reset. If it is pulled high externally, then the BSL is invoked. Therefore, unless invoking the BSL, it is important to keep PUR pulled low after a BOR reset, even if BSL or USB is never used. TI recommends a 1-MΩ resistor to ground.
- (3) The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools such as FET interfaces or GANG programmers.

5 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$, unless otherwise noted.

5.1 Absolute Maximum Ratings ⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Voltage applied at V_{CC} to V_{SS}	-0.3	4.1	V
Voltage applied to any pin (excluding V _{CORE} , V _{BUS} , V18, LDO1) ⁽²⁾	-0.3	$V_{CC} + 0.3$	V
Diode current at any device pin		±2	mA
Storage temperature, T_{stg} ⁽³⁾	-55	150	°C
Maximum junction temperature, T_J		95	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to V_{SS} . V_{CORE} is for internal device use only. No external DC loading or voltage should be applied.
- (3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

	VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

Typical values are specified at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$ (unless otherwise noted)

		MIN	NOM	MAX	UNIT

		PMMCOREV = 0, 1	2.0	3.6	
		PMMCOREV = 0, 1, 2	2.2	3.6	
		PMMCOREV = 0, 1, 2, 3	2.4	3.6	
$V_{CC,USB}$ ⁽²⁾	Supply voltage during USB operation, USB PLL disabled ($USB_EN = 1, UPLLEN = 0$)	PMMCOREV = 0	1.8	3.6	V
		PMMCOREV = 0, 1	2.0	3.6	
		PMMCOREV = 0, 1, 2	2.2	3.6	
		PMMCOREV = 0, 1, 2, 3	2.4	3.6	
	Supply voltage during USB operation, USB PLL enabled ⁽⁴⁾ ($USB_EN = 1, UPLLEN = 1$)	PMMCOREV = 2	2.2	3.6	
		PMMCOREV = 2, 3	2.4	3.6	
V_{SS}	Supply voltage ($AV_{SS1} = AV_{SS2} = AV_{SS3} = DV_{SS1} = DV_{SS2} = DV_{SS3} = V_{SS}$)		0		V
$V_{BAT,RTC}$	Backup-supply voltage with RTC operational	$T_A = 0^\circ\text{C}$ to 85°C	1.55	3.6	V
		$T_A = -40^\circ\text{C}$ to 85°C	1.70	3.6	
$V_{BAT,MEM}$	Backup-supply voltage with backup memory retained.	$T_A = -40^\circ\text{C}$ to 85°C	1.20	3.6	V
T_A	Operating free-air temperature	I version	-40	85	°C
T_J	Operating junction temperature	I version	-40	85	°C

- (1) TI recommends powering AV_{CC} and DV_{CC} from the same source. A maximum difference of 0.3 V between AV_{CC} and DV_{CC} can be tolerated during power up and operation.
- (2) Some modules may have reduced recommended ranges of operation.
- (3) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the threshold parameters in [Table 5-16](#) for the exact values and further details.
- (4) USB operation with USB PLL enabled requires $PMMCOREV \geq 2$ for proper operation.

Recommended Operating Conditions (continued)

f_{SYSTEM_USB}	Minimum processor frequency for USB operation	1.5			MHz	
USB_wait	Wait state cycles during USB operation		16		cycles	

(5) A capacitor tolerance of ±20% is required.

(6) The MSP430 CPU is clocked directly with MCLK. Both the high and low phase of MCLK must not exceed the pulse duration of the specified maximum frequency.

(7) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

NOTE: The numbers within the fields denote the supported PMMCOREVx settings.

(1) All inputs are tied to 0 V or to V_{CC} . Outputs do not source or sink any current.

(2) The currents are characterized with a Micro Crystal CC4V-T1A SMD crystal with a load capacitance of 9 pF. The internal and external load capacitance are chosen to closely match the required 9 pF.

(3) Current for watchdog timer clocked by ACLK and RTC clocked by LFXT1 (32768 Hz) included. ACLK = low-frequency crystal operation (XTS = 0, XT1DRIVEx = 0).

CPUOFF = 1, SCG0 = 1, SCG1 = 1, OSCOFF = 0 (LPM3), $f_{ACLK} = 32768$ Hz, $f_{MCLK} = f_{SMCLK} = f_{DCO} = 0$ MHz
Current for brownout included. Low-side supervisor (SVSL) and low-side monitor (SVM_L) disabled. High-side supervisor (SVSH) and high-side monitor (SVM_H) disabled. RAM retention enabled.

(4) LCDMx = 11 (4-mux mode), LCDREXT = 1, LCDEXTBIAS = 1 (external biasing), LCD2B = 0 (1/3 bias), LCDPEN = 0 (charge pump disabled), LCDSSEL = 0, LCDPREx = 101, LCDDIVx = 00011 ($f_{LCD} = 32768$ Hz / 32 / 4 = 256 Hz)
Current through external resistors not included (voltage levels are supplied by test equipment).
Even segments S0, S2, ... = 0, odd segments S1, S3, ... = 1. No LCD panel load.

(5) LCDMx = 11 (4-mux mode), LCDREXT = 0, LCDEXTBIAS = 0 (internal biasing), LCD2B = 0 (1/3 bias), LCDPEN = 0 (charge pump disabled), LCDSSEL = 0, LCDPREx = 101, LCDDIVx = 00011 ($f_{LCD} = 32768$ Hz / 32 / 4 = 256 Hz)

5.7 Thermal Resistance Characteristics

PARAMETER		VALUE	UNIT	
θ_{JA}	Junction-to-ambient thermal resistance, still air ⁽¹⁾	QFP (PZ)	122	°C/W
		BGA (ZQW)	108	
$\theta_{JC(TOP)}$	Junction-to-case (top) thermal resistance ⁽²⁾	QFP (PZ)	83	°C/W
		BGA (ZQW)	72	
θ_{JB}	Junction-to-board thermal resistance ⁽³⁾	QFP (PZ)	98	°C/W
		BGA (ZQW)	76	

- (1) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, High-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (2) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (3) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

5.8 Timing and Switching Characteristics

5.8.1 Power Supply Sequencing

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in [Absolute Maximum Ratings](#). Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and flash.

[Table 5-1](#) lists the device reset requirements.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
 - Keep the trace between the device and the crystal as short as possible.
 - Design a good ground plane around the oscillator pins.
 - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
 - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
 - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
 - If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (2) When XT1BYPASS is set, XT1 circuit is automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE_x settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
 - For XT1DRIVE_x = 0, $C_{L,eff} \leq 6$ pF.
 - For XT1DRIVE_x = 1, 6 pF $\leq C_{L,eff} \leq 9$ pF.
 - For XT1DRIVE_x = 2, 6 pF $\leq C_{L,eff} \leq 10$ pF.
 - For XT1DRIVE_x = 3, $C_{L,eff} \geq 6$ pF.
- (5) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag.
- (8) Measured with logic-level input frequency but also applies to operation with crystals.

- (1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency, f_{DCO} , should be set to reside within the range of $f_{DCO(n,0),MAX} \leq f_{DCO} \leq f_{DCO(n,31),MIN}$, where $f_{DCO(n,0),MAX}$ represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and $f_{DCO(n,31),MIN}$ represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual f_{DCO} frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

5.8.11 CTSD16

NOTE

The delta-sigma analog-to-digital converter uses the CTSD16. The CTSD16 is preceded by a unity-gain buffer stage following the channel muxing as shown in [Figure 6-2](#). See [Table 5-43](#) for the electrical characteristics of the PGA buffer stages.

[Table 5-29](#) lists the operating conditions of the CTSD16.

Table 5-29. CTSD16, Power Supply and Operating Conditions

PARAMETER		TEST CONDITIONS		V _{CC}	MIN	TYP	MAX	UNIT
V _{CC}	Supply voltage range	AVSS = DVSS = 0 V			2.2		3.6	V
I _{CTSD16}	Analog plus digital supply current per converter (reference current not included)	CTSD16OSRx = 256, CTSD16RRI = 0	GAIN: 1, 2, 4, 8, 16	3 V	190 ⁽¹⁾		300 ⁽¹⁾	μA
			GAIN: 1, 16	3 V				
I _{CTSD16CLK}	CTSD16 clock current consumption	This is requested when CTSD16 is converting, or CTSD16RRIBURST = 0, or when OA is in rail-to-rail input mode (OARRI = 1), or when OA charge pump is on. The current should only be counted once even if both OA and CTSD16 are requesting the clock.		3 V		205	240	μA

(1) See [Table 5-30](#) to calculate total current from CTSD16 for different use cases.

[Table 5-30](#) explains how to compute the total current, I_{TOTAL}, when the CTSD, along with associated modules, are used. See [Table 5-44](#) for a similar table for the OA. A "yes" means it must be included in computing I_{TOTAL}. Here is an example current calculation for CTS16D in rail-to-rail input mode (CTSD16RRI = 1) using the internal reference (CTSD16REFS = 1) and OA0 and OA1 enabled in rail-to-rail input modes, OARRI = 1.

As an example, assume that the application uses the CTS16D in rail-to-rail input mode (CTSD16RRI = 1) with the internal reference (CTSD16REFS = 1) and OA0 and OA1 are enabled in rail-to-rail input modes, OARRI = 1. The total current, I_{TOTAL}, would be computed as follows:

$$I_{TOTAL} = I_{CTSD16} + I_{CTSD16CLK} + I_{CP} + I_{REFBG} + 2 \times I_{OA} \quad (1)$$

Table 5-30. CTSD16, Current Calculation

USE CASE NAME	USE CASE DETAILS	I _{CTSD16}	I _{CTSD16CLK} ⁽¹⁾	I _{CP} ⁽²⁾	I _{REFBG} ⁽³⁾	I _{REF} ⁽⁴⁾
CTSD16		yes	yes	no	yes if CTSD16REFS = 1 no if CTSD16REFS = 0	yes
CTSD16 rail-to-rail inputs	CTSD16RRI = 1	yes	yes	yes	yes if CTSD16REFS = 1 no if CTSD16REFS = 0	yes

(1) Count this only once no matter how many modules use it. OA can also use this when rail-to-rail input is selected.

(2) Count this only once no matter how many modules use it. OA also uses this. This current is listed in [Table 5-43](#).

(3) Count this only once no matter how many modules use it. DAC can use this as well as internal reference when it is available externally, REFOUT = 1. This current is listed in [Table 5-36](#).

(4) Count this only once no matter how many modules use it. This current is listed in [Table 5-43](#). If I_{REFBG} is used that includes I_{REF} current.

Table 5-31 lists the characteristics of the CTSD16 external voltage reference.

Z _I	Input impedance (pin Ax or ADx+ or ADx- to AVSS)	CTSD16GAINx = 1, 16	3 V		20		MΩ
Z _{ID}	Differential input impedance (pin ADx+ to pin ADx-)	CTSD16GAINx = 1, 16	3 V		35		MΩ
V _I	Absolute input voltage range			AVSS		V _{CC}	V
V _{IC}	Common-mode input voltage range			AVSS		V _{CC}	V

(1) All parameters pertain to each CTSD16 input.

(2) The full-scale range is defined by V_{FSR+} = +V_R/GAIN and V_{FSR-} = -V_R/GAIN; FSR = V_{FSR+} - V_{FSR-} = 2xV_R/GAIN. If V_R is sourced externally, the analog input range should not exceed 80% of V_{FSR+} or V_{FSR-}; that is, V_{ID} = 0.8 V_{FSR-} to 0.8 V_{FSR+}. If V_R is sourced internally, the given V_{ID} ranges apply.

Table 5-33 lists the performance characteristics of the CTSD16.

		CTSD16GAINx = 16, V _{ID} = 58 mV, f _{IN} = 50 Hz		80			

(1) The following voltages were applied to the CTSD16 inputs:

$$V_{I,A+}(t) = 0 \text{ V} + V_{PP}/2 \times \sin(2\pi \times f_{IN} \times t)$$

$$V_{I,A-}(t) = 0 \text{ V} - V_{PP}/2 \times \sin(2\pi \times f_{IN} \times t)$$

resulting in a differential voltage of $V_{ID} = V_{I,A+}(t) - V_{I,A-}(t) = V_{PP} \times \sin(2\pi \times f_{IN} \times t)$ with V_{PP} being selected as the maximum value allowed for a given range (according to CTSD16 input range).

Table 5-35 lists the characteristics of the temperature sensor.

Table 5-35. Temperature Sensor

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{sensor}	Temperature sensor output voltage ^{(1) (2)}	CTSD16ON = 1, CTSD16INCH = 110, $V_{CC} = 3\text{ V}$, $T_A = 30^\circ\text{C}$		800		mV
I_{sensor}	Temperature sensor quiescent current consumption	CTSD16ON = 1, CTSD16INCH = 110, $T_A = 85^\circ\text{C}$		2		μA

- (1) The temperature sensor offset can be as much as $\pm 30^\circ\text{C}$. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
- (2) The device descriptor structure contains calibration values for $30^\circ\text{C} \pm 3^\circ\text{C}$ and $85^\circ\text{C} \pm 3^\circ\text{C}$ for each of the available reference voltage levels. The sensor voltage can be computed as $V_{SENSE} = TC_{SENSOR} * (\text{Temperature}, ^\circ\text{C}) + V_{SENSOR}$, where TC_{SENSOR} and V_{SENSOR} can be computed from the calibration values for higher accuracy.

5.8.12 REF

Table 5-36 lists the characteristics of the REF and REFBG built-in reference.

Table 5-36. REF and REFBG, Built-In Reference

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{REFBG}	Operating supply current into AVCC terminal ⁽¹⁾	$V_{CC} = 3.0\text{ V}$, REFON = 1 and REFOUT = 1		110	130	μA
V_{REFBG}	Bandgap output voltage calibrated	$V_{CC} = 3.0\text{ V}$, $V_{eREF+} \leq 1.5\text{ V}$ if used	1.146	1.16	1.174	V
I_{REF}	Operating supply current into AVCC terminal ⁽¹⁾	$V_{CC} = 3.0\text{ V}$, REFON = 1		15	20	μA
V_{REF}	Positive built-in reference voltage output	REFVSEL = {2} for 2.5 V, REFON = 1		2.5	$\pm 1\%$	V
		REFVSEL = {1} for 2.0 V, REFON = 1		2.0	$\pm 1\%$	
		REFVSEL = {0} for 1.5 V, REFON = 1		1.5	$\pm 1\%$	
$AV_{CC(min)}$	AVCC minimum voltage, Positive built-in reference active	DAC12SREFx = 0, REFVSEL = {0} for 1.5 V		2.2		V
		DAC12SREFx = 0, REFVSEL = {1} for 2 V		2.3		
		DAC12SREFx = 0, REFVSEL = {2} for 2.5 V		2.8		
PSRR_DC	Power supply rejection ratio (DC)	$V_{CC} = 2.2\text{ V}$ to 3.6 V, $T_A = 25^\circ\text{C}$		50		$\mu\text{V/V}$
PSRR_AC	Power supply rejection ratio (AC)	$V_{CC} = 2.2\text{ V}$ to 3.6 V, $T_A = 25^\circ\text{C}$, $f = 1\text{ kHz}$, $\Delta V_{pp} = 100\text{ mV}$		1.5		mV/V
TC_{REF+}	Bandgap reference temperature coefficient ⁽²⁾	$I_{VREF+} = 0\text{ A}$		15	50	ppm/ $^\circ\text{C}$
t_{SETTLE}	Settling time of V_{REFBG} reference voltage ⁽³⁾	$AV_{CC} = AV_{CC(min)}$ through $AV_{CC(max)}$, REFON = 0 \rightarrow 1			120	μs
C_{VREFBG}	Capacitance at VREFBG terminal	See ⁽⁴⁾			1	nF
I_{LOAD}	VREFBG maximum load current	REFOUT = REFON = 1			1	mA
$I_{L(VREFBG)}$	Load-current regulation, VREFBG terminal ⁽⁵⁾	$I_{(VREF+)} = +1\text{ mA}$ or -1 mA , $AV_{CC} = AV_{CC(min)}$, REFON = REFOUT = 1			3.5	mV/mA

(1) The internal reference current is supplied from terminal AVCC. Consumption is independent of the CTSD16ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion.

(2) Calculated using the box method: $(\text{MAX}(-40^\circ\text{C}$ to $85^\circ\text{C}) - \text{MIN}(-40^\circ\text{C}$ to $85^\circ\text{C})) / \text{MIN}(-40^\circ\text{C}$ to $85^\circ\text{C}) / (85^\circ\text{C} - (-40^\circ\text{C}))$.

(3) The condition is that the error in a conversion started after t_{REFON} is less than ± 0.5 LSB.

(4) There is no capacitance required on VREFBG if the reference voltage is not used externally. However, TI recommends a capacitance close to the maximum value to reduce any reference voltage noise.

(5) Contribution only due to the reference and buffer including package. This does not include resistance due to PCB traces or other external factors.

5.8.13 DAC

	DAC12_xDAT = 800h, VeREF+ = 1.16 V or 2.5 V, ΔAV _{CC} = 100 mV	3 V		70		

(1) No load at the output pin, DAC12_0 or DAC12_1, assuming that the control bits for the shared pins are set properly.

(2) Current into reference terminals not included. If DAC12IR = 1 current flows through the input divider; see Reference Input specifications Table 5-40.

(3) PSRR = 20 log (ΔAV_{CC} / ΔV_{DAC12_xOUT})

(4) The internal reference is not used.

- (1) Parameters calculated from the best-fit curve from 0x0F to 0xFFF. The best-fit curve method is used to deliver coefficients "a" and "b" of the first-order equation: $y = a + bx$. $V_{DAC12_xOUT} = E_O + (1 + E_G) \times (V_{eREF+}/4095) \times DAC12_xDAT$, DAC12IR = 1.
- (2) The offset calibration works on the output operational amplifier. Offset Calibration is triggered setting bit DAC12CALON
- (3) The offset calibration can be done if DAC12AMP_x = {2, 3, 4, 5, 6, 7}. The output operational amplifier is switched off with DAC12AMP_x = {0, 1}. TI recommends configuring the DAC12 module before initiating calibration. Port activity during calibration may affect accuracy and is not recommended.

		f = 50 kHz, OARRI = 0h or 1h	3.0 V	25		

(1) See Table 5-44 to calculate total current from OA for different use cases.

(2) The common-mode input range is measured with the OA in a unity-gain source-follower configuration. The input signal is swept from 0 V to V_{CC}, and the output of the OA is monitored. The minimum and maximum values represent when the input and output differ more than 10 mV, not including the offset, V_{OS}.

t _{SETTLE}	Settling time	Noninverting, unity gain, 2.0-V step, 0.1%, OAM = 1h	3.0 V		5.3		μs
V _O	Voltage output swing from rail	–250 μA ≤ I _O ≤ 250 μA, Noninverting, unity gain (OAM = 1h)			5	55	mV
t _{EN_FAST}	Enable time fast	Noninverting, unity gain, OAM = 0h transition to 1h, AFE biases previously enabled and settled which can be done with REFON = 1 or other modules requesting REFON ⁽³⁾			3	7	μs
t _{EN_SLOW}	Enable time slow	Noninverting, unity gain, OARRI = 0h transition to 1h, OAM = 0h transition to 1h, Includes AFE bias and charge pump settling ⁽³⁾			190	225	μs
t _{DIS}	Disable time				0.4		μs

(3) The AFE bias is used by several modules including the OA charge pump, OA, and CTSD16. Any of these modules will request the AFE bias when enabled. The AFE bias is generated by the REF module, so enabling the REF module also enables the AFE bias.

Table 5-44 explains how to compute the total current, I_{TOTAL}, when the OA and associated modules are used. See Table 5-30 for a similar table for the CTSD16. A "yes" means it must be included in computing I_{TOTAL}.

As an example, assume that the application uses the CTS16D in rail-to-rail input mode (CTSD16RRI = 1) with the internal reference (CTSD16REFS = 1) and OA0 and OA1 are enabled in rail-to-rail input modes, OARRI = 1. The total current, I_{TOTAL}, would be computed as follows:

$$I_{TOTAL} = I_{CTSD16} + I_{CTSD16CLK} + I_{CP} + I_{REFBG} + 2 \times I_{OA}$$

Table 5-44. OA, Current Calculation

USE CASE NAME	USE CASE DETAILS	I _{OA}	I _{CTSD16CLK} ⁽¹⁾	I _{CP} ⁽²⁾	I _{REF} ⁽³⁾
OA	OARRI = 0	yes	no	no	yes
OA with rail-to-rail input	OARRI = 1	yes	yes	yes	yes
Rail-to-rail input up, module off	(CTSD16SC = 0) AND (CTSD16RRI = 1) AND (CTSD16RRIBURST = 0) OR ((OARRI = 1 (for any OA)) AND (OAM = 0))	no	yes	yes	yes

- (1) Count this current only once no matter how many modules use it. CTSD16 and the charge pump also use this. This current is listed in [Table 5-29](#).
- (2) Count this current only once no matter how many modules use it. CTSD16 also uses this when rail-to-rail inputs are selected.
- (3) Count this current only once no matter how many modules use it. This current is listed in [Table 5-43](#). If I_{REFBG} is used, that includes the I_{REF} current.

5.8.15 Switches

[Table 5-45](#) lists the characteristics of the ground switches.

Table 5-45. Ground Switches (GSW0A, GSW0B, GSW1A, GSW1B)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

 (2) f_{TCK} may be restricted to meet the timing requirements of the module selected.

6 Detailed Description

6.1 Overview

The MSP430FG6626 and MSP430FG6625 are microcontroller configurations with a high-performance 16-bit ADC, dual 12-bit DACs, dual low-power operational amplifiers, a comparator (COMPB), two USCIs, USB 2.0, a hardware multiplier (MPY32), DMA, four 16-bit timers, an RTC module with alarm capabilities, an LCD driver, and up to 73 I/O pins.

The MSP430FG6426 and MSP430FG6425 are microcontroller configurations with a high-performance 16-bit ADC, dual 12-bit DACs, dual low-power operational amplifiers, a comparator (COMPB), two USCIs, a 3.3-V LDO, a hardware multiplier (MPY32), DMA, four 16-bit timers, an RTC module with alarm capabilities, an LCD driver, and up to 73 I/O pins.

6.2 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock. Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [Figure 6-1](#)).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

6.3 Instruction Set

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data. [Table 6-1](#) lists examples of the three types of instruction formats, and [Table 6-2](#) lists the address modes.

Table 6-1. Instruction Word Formats

INSTRUCTION WORD FORMAT	EXAMPLE	OPERATION

6.4 Operating Modes

The devices have one active mode and seven software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

Software can configure the following operating modes:

- Active mode (AM)
 - All clocks are active
- Low-power mode 0 (LPM0)
 - CPU is disabled
 - ACLK and SMCLK remain active, MCLK is disabled
 - FLL loop control remains active
- Low-power mode 1 (LPM1)
 - CPU is disabled
 - FLL loop control is disabled
 - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
 - CPU is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DC generator of the DCO remains enabled
 - ACLK remains active
- Low-power mode 3 (LPM3)
 - CPU is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DC generator of the DCO is disabled
 - ACLK remains active
- Low-power mode 4 (LPM4)
 - CPU is disabled
 - ACLK is disabled
 - MCLK, FLL loop control, and DCOCLK are disabled
 - DC generator of the DCO is disabled
 - Crystal oscillator is stopped
 - Complete data retention
- Low-power mode 3.5 (LPM3.5)
 - Internal regulator disabled
 - No data retention
 - RTC enabled and clocked by low-frequency oscillator
 - Wake-up input from $\overline{\text{RST}}/\text{NMI}$, RTC_B, P1, P2, P3, and P4
- Low-power mode 4.5 (LPM4.5)
 - Internal regulator disabled
 - No data retention
 - Wake-up input from $\overline{\text{RST}}/\text{NMI}$, P1, P2, P3, and P4

6.5 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see [Table 6-3](#)). The vector contains the 16-bit address of the appropriate interrupt-handler instruction sequence.

(1) Multiple source flags

(2) A reset is generated if the CPU tries to fetch instructions from within peripheral space or vacant memory space.

(Non)maskable: the individual interrupt enable bit can disable an interrupt event, but the general interrupt enable bit cannot disable it.

(3) Interrupt flags are in the module.

(4) Only on devices with peripheral module USB (MSP430FG6626 and MSP430FG6625)

(5) Only on devices with peripheral module LDO-PWR (MSP430FG6426 and MSP430FG6425)

Table 6-3. Interrupt Sources, Flags, and Vectors (continued)

(6) Reserved interrupt vectors at addresses are not used in this device and can be used for regular program code if necessary. To maintain compatibility with other devices, TI recommends reserving these locations.

6.6 USB BSL

The devices MSP430FG6626 and MSP430FG6625 are preprogrammed with the USB BSL. Use of the USB BSL requires external access to six pins (see [Table 6-4](#)). In addition to these pins, the application must support external components necessary for normal USB operation; for example, the proper crystal on XT2IN and XT2OUT, proper decoupling, and so on.

Table 6-4. USB BSL Pin Requirements and Functions

DEVICE SIGNAL	BSL FUNCTION
RST/NMI/SBWDIO	Entry sequence signal
PU.0/DP	USB data terminal DP
PU.1/DM	USB data terminal DM
PUR	USB pullup resistor terminal
VBUS	USB bus power supply
VSSU	USB ground supply

NOTE

The default USB BSL evaluates the logic level of the PUR pin after a BOR reset. If it is pulled high externally, then the BSL is invoked. Therefore, unless the application is invoking the BSL, it is important to keep PUR pulled low after a BOR reset, even if BSL or USB is never used. TI recommends applying a 1-MΩ resistor to ground.

6.7 UART BSL

Devices without a USB module (MSP430FG642x) come preprogrammed with the UART BSL. A UART BSL is also available for devices with the USB module (MSP430FG662x), and it can be programmed by the user into the BSL memory by replacing the preprogrammed factory-supplied USB BSL. Use of the UART BSL requires external access to six pins (see [Table 6-5](#)).

Table 6-5. UART BSL Pin Requirements and Functions

DEVICE SIGNAL	BSL FUNCTION
RST/NMI/SBWDIO	Entry sequence signal
TEST/SBWTCK	Entry sequence signal
P1.1	Data transmit
P1.2	Data receive
VCC	Power supply
VSS	Ground supply

6.8 JTAG Operation

6.8.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface, which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/Os. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the $\overline{\text{RST}}$ /NMI/SBWDIO is required to interface with MSP430 development tools and device programmers. [Table 6-6](#) lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

Table 6-6. JTAG Pin Requirements and Functions

DEVICE SIGNAL	DIRECTION	FUNCTION
PJ.3/TCK	IN	JTAG clock input

TEST/SBWTCK	IN	Enable JTAG pins
$\overline{\text{RST}}$ /NMI/SBWDIO	IN	External reset
VCC		Power supply
VSS		Ground supply

6.8.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the two-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. [Table 6-7](#) lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#). For a complete description of the features of the JTAG interface and its implementation, see [MSP430 Programming With the JTAG Interface](#).

$\overline{\text{RST}}$ /NMI/SBWDIO	IN, OUT	Spy-Bi-Wire data input/output
VCC		Power supply
VSS		Ground supply

6.9 Flash Memory

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually, or as a group with segments 0 to n . Segments A to D are also called *information memory*.
- Segment A can be locked separately.

6.10 RAM

The RAM is made up of n sectors. Each sector can be completely powered down to save leakage; however, all data is lost. Features of the RAM include:

- RAM has n sectors. The size of a sector can be found in [Section 6.15](#).
- Each sector 0 to n can be complete disabled; however, data retention is lost.
- Each sector 0 to n automatically enters low-power retention mode when possible.
- For devices that contain USB memory, the USB memory can be used as normal RAM if USB is not required.

6.11 Backup RAM

The backup RAM provides a limited number of bytes of RAM that are retained during LPMx.5 and during operation from a backup supply if the Battery Backup System module is implemented.

There are 8 bytes of backup RAM. It can be word-wise accessed through the control registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3.

6.12 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. The peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

6.12.1 Digital I/O

Up to nine 8-bit I/O ports are implemented: P1 through P9 are complete except P5.2, and port PJ contains four individual I/O ports.

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Programmable drive strength on all ports.
- Edge-selectable interrupt input capability for all the eight bits of ports P1, P2, P3, and P4.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 through P9) or word-wise (P1 through P8) in pairs (PA through PD).

6.12.2 Port Mapping Controller

The port mapping controller allows the flexible and reconfigurable mapping of digital functions to port P2 (see [Table 6-8](#)).

(1) The value of the PM_ANALOG mnemonic is set to 0FFh. The port mapping registers are only 5 bits wide, and the upper bits are ignored, which results in a read out value of 31.

Table 6-9 lists the default settings for all pins that support port mapping.

6.12.3 Oscillator and System Clock

The clock system in the MSP430FG662x and MSP430FG642x devices are supported by the Unified Clock System (UCS) module that includes support for a 32-kHz watch crystal oscillator (in XT1 LF mode; XT1 HF mode is not supported), an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator XT2. The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the watch crystal frequency. The internal DCO provides a fast turnon clock source and stabilizes in 3 μ s (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32-kHz watch crystal (XT1), a high-frequency crystal (XT2), the internal low-frequency oscillator (VLO), the trimmed low-frequency oscillator (REFO), or the internal digitally-controlled oscillator (DCO).
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

6.12.4 Power Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, as well as brownout protection. The brownout circuit provides the proper internal reset signal to the device during power on and power off. The SVS and SVM circuitry detect if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and the core supply.

6.12.5 Hardware Multiplier (MPY32)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

6.12.6 Real-Time Clock (RTC_B)

The RTC_B module can be configured for real-time clock (RTC) or calendar mode providing seconds, minutes, hours, day of week, day of month, month, and year. Calendar mode integrates an internal calendar which compensates for months with less than 31 days and includes leap year correction. The RTC_B also supports flexible alarm functions and offset-calibration hardware. The implementation on this device supports operation in LPM3.5 mode and operation from a backup supply.

6.12.7 Watchdog Timer (WDT_A)

The primary function of the WDT_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

6.12.8 System Module (SYS)

The SYS module handles many of the system functions within the device. These include power-on reset and power-up clear handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). SYS also includes a data exchange mechanism through JTAG called a JTAG mailbox that can be used in the application. [Table 6-10](#) lists the SYS module interrupt vector registers.

6.12.9 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral.

The USB timestamp generator also uses the channel 0, 1, and 2 DMA trigger assignments (see [Table 6-11](#)). The USB timestamp generator is available only on devices with the USB module (MSP430FG662x).

6.12.10 Universal Serial Communication Interface (USCI)

The USCI modules are used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I²C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA. Each USCI module contains two portions, A and B.

The USCI_An module provides support for SPI (3- or 4-pin), UART, enhanced UART, or IrDA.

The USCI_Bn module provides support for SPI (3- or 4-pin) or I²C.

The MSP430FG662x and MSP430FG642x include two complete USCI modules (n = 0 to 1).

6.12.11 Timer TA0

Timer TA0 is a 16-bit timer/counter (Timer_A type) with five capture/compare registers. TA0 supports multiple capture/compares, PWM outputs, and interval timing (see [Table 6-12](#)). It also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.12.12 Timer TA1

Timer TA1 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA1 supports multiple capture/compares, PWM outputs, and interval timing (see [Table 6-13](#)). It also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.12.13 Timer TA2

Timer TA2 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA2 supports multiple capture/compares, PWM outputs, and interval timing (see [Table 6-14](#)). It also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.12.14 Timer TB0

Timer TB0 is a 16-bit timer/counter (Timer_B type) with seven capture/compare registers. TB0 supports multiple capture/compares, PWM outputs, and interval timing (see [Table 6-15](#)). It also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) Timer functions are selectable by the port mapping controller.

6.12.15 *Comparator_B*

The primary function of the Comparator_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

6.12.16 *Signal Chain*

All devices include all the building blocks to construct a complete signal chain. These blocks include two digital-to-analog converter (DAC) channels, two integrated operational amplifiers (OAs), a sigma-delta analog-to-digital converter (CTSD16), and low-ohmic switches (GSW). [Figure 6-2](#) shows the various signal chain blocks and their interconnections in the overall system.

NOTE: See the [MSP430F5xx and MSP430F6xx Family User's Guide](#) for additional module details.

Figure 6-2. Signal Chain

6.12.16.1 CTSD16

The CTSD16 module integrates a single sigma-delta ADC with ten external inputs and four internal inputs. The converter is designed with a fully differential analog input pair and a programmable gain amplifier input stage. The converter is based on second-order over-sampling sigma-delta modulators and digital decimation filters. The decimation filters are comb type filters with selectable oversampling ratios of up to 256.

The CTSD16 is preceded by an analog multiplexer which is used for channel selection, followed by a unity gain buffer stage useful when sampling high impedance sensors.

The CTSD16 can use as its reference the internal bandgap voltage from the REF module or an external reference at the VeREF+ pin.

6.12.16.2 DAC12_A

The DAC12_A module is a 12-bit R-ladder voltage-output DAC. The DAC12_A can be used in 8-bit or 12-bit mode, and can be used in conjunction with the DMA controller. When multiple DAC12_A modules are present, they may be grouped together for synchronous operation. Two complete channels are available, DAC12_0 and DAC12_1.

6.12.16.3 Operational Amplifiers (OA)

The device integrates two low-power operational amplifiers. The operational amplifiers can perform signal conditioning of low-level analog signals before conversion by the ADC. Each operational amplifier can be individually controlled by software.

6.12.16.4 Ground Switches (GSW)

The device integrates four low-ohmic switches to ground that are individually controllable in software. These can switch in and out various components in the measurement system.

6.12.17 REF Voltage Reference

The reference module (REF) generates all of the critical reference voltages that can be used by the various analog peripherals in the device.

6.12.18 CRC16

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

6.12.19 LCD_B

The LCD_B driver generates the segment and common signals that are required to drive a liquid crystal display (LCD). The LCD_B controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, and 4-mux LCDs are supported. The module can provide a LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage, and thus contrast, by software. The module also provides an automatic blinking capability for individual segments.

6.12.20 USB Universal Serial Bus

The USB module is a fully integrated USB interface that is compliant with the USB 2.0 specification. The module supports full-speed operation of control, interrupt, and bulk transfers. The module includes an integrated LDO, PHY, and PLL. The PLL is highly flexible and can support a wide range of input clock frequencies. USB RAM, when not used for USB communication, can be used by the system.

The USB module is only available on the MSP430FG662x devices.

6.12.21 LDO and PU Port

The integrated 3.3-V power system incorporates an integrated 3.3-V LDO regulator that allows the entire MSP430 microcontroller to be powered from nominal 5-V LDO when it is made available for the system. Alternatively, the power system can supply power only to other components within the system, or it can be unused altogether.

The Port U pins (PU.0 and PU.1) function as general-purpose high-current I/O pins. These pins must be configured together as either both inputs or both outputs. Port U is supplied by the LDO rail. If the 3.3-V LDO is not used in the system (disabled), the LDO pin can be supplied externally.

The LDO-PWR module (LDO and PU port) is available only on the MSP430FG6426 and MSP430FG6425 devices.

6.12.22 Embedded Emulation Module (EEM) (L Version)

The EEM supports real-time in-system debugging. The L version of the EEM has the following features:

- Eight hardware triggers or breakpoints on memory access.
- Two hardware triggers or breakpoints on CPU register write access.
- Up to ten hardware triggers can be combined to form complex triggers or breakpoints.
- Two cycle counters
- Sequencer
- State storage
- Clock control on module level

		VeREF+ ⁽⁵⁾	X	1	0	X	0
		VREFBG ⁽⁶⁾	X	1	1	1	1

- (1) X = Don't care
- (2) If a module is requesting a reference then REFON need not be set to 1 for VREFBG to be selected on P5.0.
- (3) If CTSD16 is active, this bit must be set as shown in the table. Otherwise if set to 1, it will force VREFBG to be selected regardless of REFOUT setting and if P5SEL.x is set to 0 it will cause possible contention on the I/O.
- (4) Default condition
- (5) Setting the P5SEL.0 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. An external voltage can be applied to VeREF+ and used as the reference for the CTSD16 or DAC.
- (6) Setting the P5SEL.0 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. The internal reference voltage signal, V_{REFBG}, is available at the pin.

- (1) X = Don't care
- (2) Setting the P6SEL.x bit, the CBPD.x bit, or the OAMx bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals.
- (3) Setting OAMx = 0 disables the operational amplifier and its output is high impedance. Setting OAMx = 1 enables the operational amplifier output. Because the operational amplifier output is shared with the ADC channel, selection of the respective ADC channel allows for direct measurement of the output voltage of the amplifier.
- (4) The ADC channel Ax is connected internally to AV_{SS} if not selected by the respective INCHx bits.

6.16 Identification

6.16.1 Revision Identification

The device revision information is shown as part of the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to all of the errata sheets for the devices in this data sheet, see .

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Hardware Revision" entries in [Section 6.14](#).

6.16.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to all of the errata sheets for the devices in this data sheet, see .

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Device ID" entries in [Section 6.14](#).

6.16.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in detail in the [MSP430 Programming With the JTAG Interface User's Guide](#).

7 Applications, Implementation, and Layout

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Device Connection and Layout Fundamentals

This section discusses the recommended guidelines when designing with the MSP430. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

7.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 1- μ F plus a 100-nF low-ESR ceramic decoupling capacitor to each AVCC and DVCC pin. Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, separated grounds with a single-point connection are recommended for better noise isolation from digital to analog circuits on the board and are especially recommended to achieve high analog accuracy.

Figure 7-1. Power Supply Decoupling

7.1.2 External Oscillator

Depending on the device variant (see [Section 3](#)), the device can support a low-frequency crystal (32 kHz) on the XT1 pins, a high-frequency crystal on the XT2 pins, or both. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the XIN and XT2IN input pins that meet the specifications of the respective oscillator if the appropriate XT1BYPASS or XT2BYPASS mode is selected. In this case, the associated XOUT and XT2OUT pins can be used for other purposes. If they are left unused, they must be terminated according to [Table 4-4](#).

[Figure 7-2](#) shows a typical connection diagram.

Figure 7-2. Typical Crystal Connection

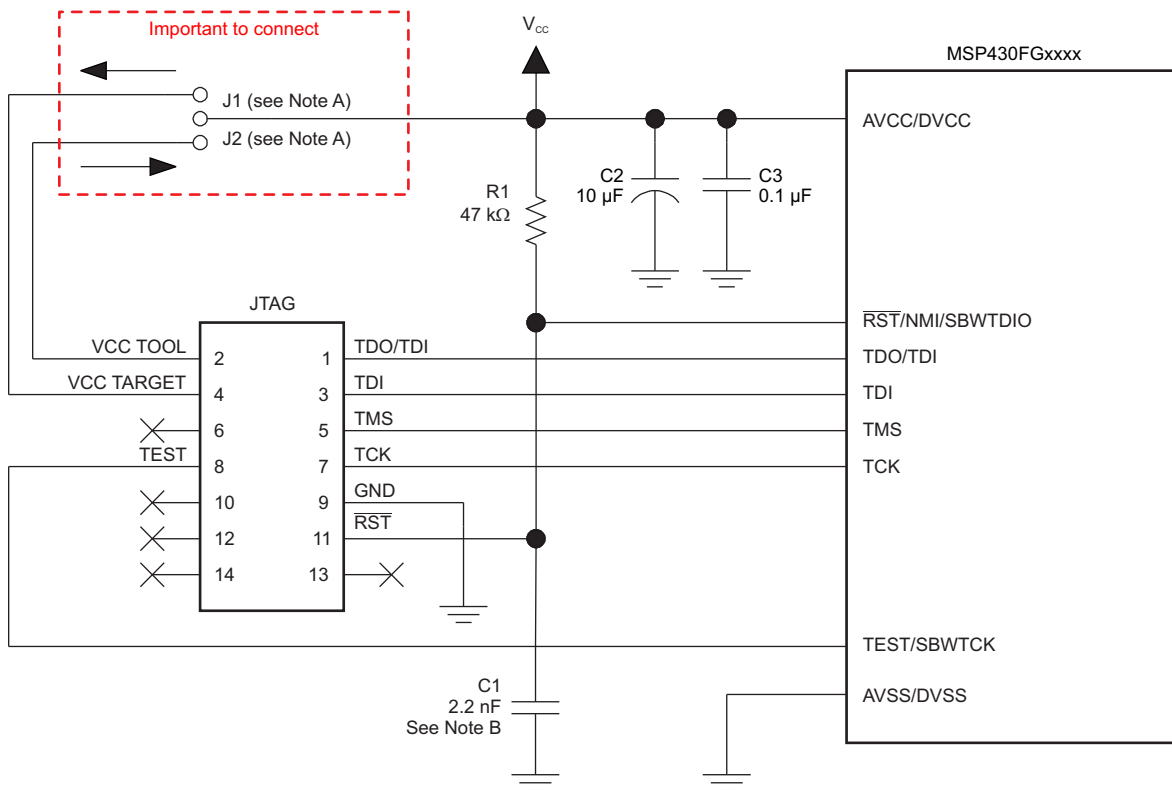

See [MSP430 32-kHz Crystal Oscillators](#) for more information on selecting, testing, and designing a crystal oscillator with the MSP430 devices.

7.1.3 JTAG

With the proper connections, the debugger and a hardware JTAG interface (such as the MSP-FET or MSP-FET430UIF) can be used to program and debug code on the target board. In addition, the connections also support the MSP-GANG production programmers, thus providing an easy way to program prototype boards, if desired. [Figure 7-3](#) shows the connections between the 14-pin JTAG connector and the target device required to support in-system programming and debugging for 4-wire JTAG communication. [Figure 7-4](#) shows the connections for 2-wire JTAG mode (Spy-Bi-Wire).

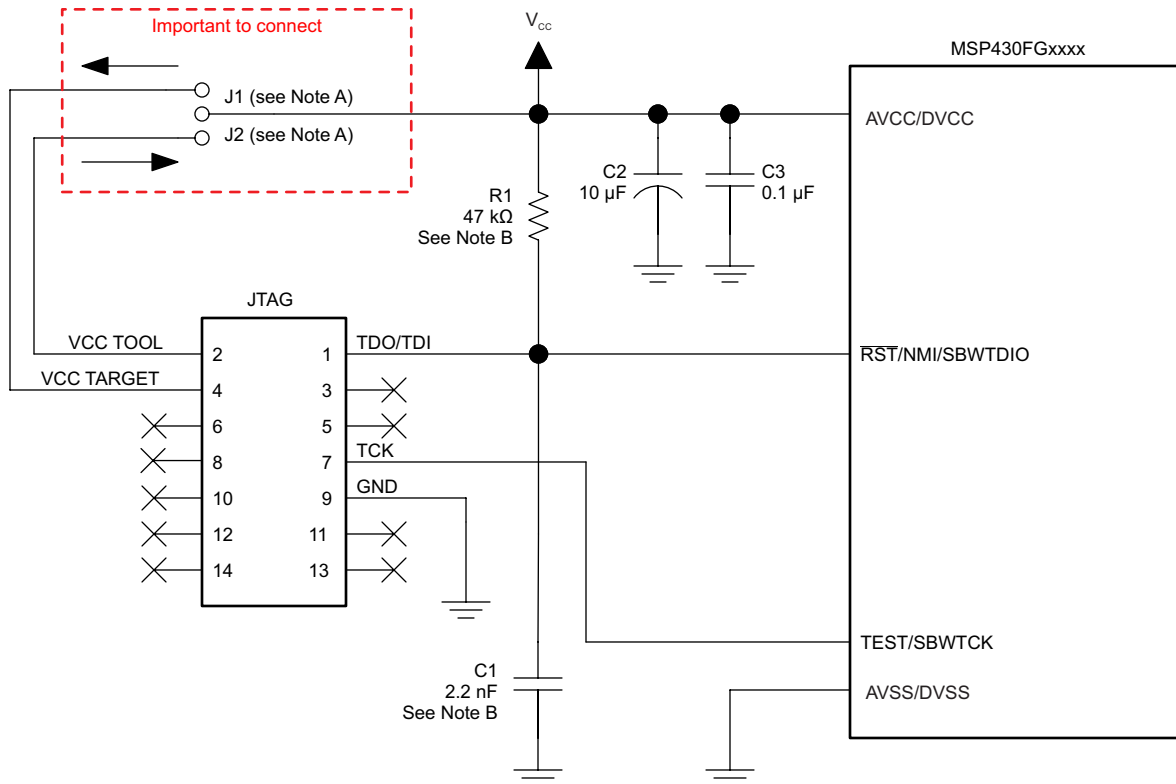

The connections for the MSP-FET and MSP-FET430UIF interface modules and the MSP-GANG are identical. Both can supply VCC to the target board (through pin 2). In addition, the MSP-FET and MSP-FET430UIF interface modules and MSP-GANG have a VCC sense feature that, if used, requires an alternate connection (pin 4 instead of pin 2). The VCC-sense feature senses the local VCC present on the target board (that is, a battery or other local power supply) and adjusts the output signals accordingly. [Figure 7-3](#) and [Figure 7-4](#) show a jumper block that supports both scenarios of supplying VCC to the target board. If this flexibility is not required, the desired VCC connections may be hard-wired to eliminate the jumper block. Pins 2 and 4 must not be connected at the same time.

For additional design information regarding the JTAG interface, see the [MSP430 Hardware Tools User's Guide](#).

- A. If a local target power supply is used, make connection J1. If power from the debug or programming adapter is used, make connection J2.
- B. The upper limit for C1 is 2.2 nF when using current TI tools.

Figure 7-3. Signal Connections for 4-Wire JTAG Communication

- Make connection J1 if a local target power supply is used, or make connection J2 if the target is powered from the debug or programming adapter.
- The device $\overline{\text{RST}}/\text{NMI}/\text{SBWT DIO}$ pin is used in 2-wire mode for bidirectional communication with the device during JTAG access, and any capacitance that is attached to this signal may affect the ability to establish a connection with the device. The upper limit for C1 is 2.2 nF when using current TI tools.

Figure 7-4. Signal Connections for 2-Wire JTAG Communication (Spy-Bi-Wire)

7.1.4 Reset

The reset pin can be configured as a reset function (default) or as an NMI function in the Special Function Register (SFR), SFRRPCR.

In reset mode, the $\overline{\text{RST}}/\text{NMI}$ pin is active low, and a pulse applied to this pin that meets the reset timing specifications generates a BOR-type device reset.

Setting SYSNMI causes the $\overline{\text{RST}}/\text{NMI}$ pin to be configured as an external NMI source. The external NMI is edge sensitive, and its edge is selectable by SYSNMIIES. Setting the NMIIE enables the interrupt of the external NMI. When an external NMI event occurs, the NMIIFG is set.

The $\overline{\text{RST}}/\text{NMI}$ pin can have either a pullup or pulldown that is enabled or not. SYSRSTUP selects either pullup or pulldown, and SYSRSTRE causes the pullup (default) or pulldown to be enabled (default) or not. If the $\overline{\text{RST}}/\text{NMI}$ pin is unused, it is required either to select and enable the internal pullup or to connect an external 47-k Ω pullup resistor to the $\overline{\text{RST}}/\text{NMI}$ pin with a 2.2-nF pulldown capacitor. The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

See the [MSP430F5xx and MSP430F6xx Family User's Guide](#) for more information on the referenced control registers and bits.

7.1.5 Unused Pins

For details on the connection of unused pins, see [Section 4.6](#).

7.1.6 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. See [MSP430 32-kHz Crystal Oscillators](#) for recommended layout guidelines.
- Proper bypass capacitors on DVCC, AVCC, and reference pins if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. See [MSP430 System-Level ESD Considerations](#) for guidelines.

7.1.7 Do's and Don'ts

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in [Absolute Maximum Ratings](#). Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and flash.

7.2 Peripheral- and Interface-Specific Design Information

7.2.1 CTSD16 Peripheral

For internal connections between signal chain modules such as CTSD16, OA, and DAC12, see [Section 6.12.16](#). When internal connections are available, they should be chosen over external connections to reduce noise and save pins.

Solid decoupling on both the digital and analog supplies is also required (best with two capacitors, one 1 μ F and one 100 nF [see [Section 7.1.1](#)]).

- The capacitor reduces noise when using internal V_{REFBG} setting. This pin is also used for the external reference input for the CTSD16 or DAC, and when doing so the capacitor is not needed. Because of the shared signal path and pin, the internal and external references (V_{REFBG} and V_{eREF+} , respectively) cannot be used at the same time.
- The capacitor on CPCAP is required when the charge pump is enabled. The charge pump can be enabled by rail-to-rail operation of the CTSD16 or by the OA module. See the register settings for each module in the [MSP430F5xx and MSP430F6xx Family User's Guide](#) for enabling this operation.

Figure 7-5. CTSD16 Partial Schematic

7.2.1.1 Example Measurement Schematic – Differential Input

- A. TI recommends an external RC antialiasing low-pass filter for the CTSD16 to prevent aliasing of the input signal. The cutoff frequency should be <10 kHz for a 1-MHz modulator clock and $OSR = 256$. The cutoff frequency may be set to a lower frequency for applications that have lower bandwidth requirements. It is up to the user to determine the configuration and type of low-pass filter used.

Figure 7-6. CTSD16 Measurement Schematic – Differential Input

7.2.1.2 Example Measurement Schematic – Single-Ended Input

- A. TI recommends an external RC antialiasing low-pass filter for the CTSD16 to prevent aliasing of the input signal. The cutoff frequency should be <10 kHz for a 1-MHz modulator clock and $OSR = 256$. The cutoff frequency may be set to a lower frequency for applications that have lower bandwidth requirements. It is up to the user to determine the configuration and type of low-pass filter used.

Figure 7-7. CTSD16 Measurement Schematic – Single-Ended Input

7.2.1.3 Design Requirements

As with any high-resolution ADC, appropriate printed circuit board layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. Therefore, solid decoupling on both the digital and analog supplies is required (best with two capacitors, one 1 μF and one 100 nF [see Section 7.1.1]).

In addition to grounding, ripple and noise spikes on the power-supply lines due to digital switching or switching power supplies can corrupt the conversion result. TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy.

If the internal reference is used, the reference voltage should be buffered externally by connecting a small (approximately 1 nF) capacitor to the VREFBG pin to reduce the noise on the reference.

The CTSD16 has a fixed 1.024-MHz clock (f_M). Fault flags for this oscillator are described in the CTSD16 and UCS section of the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

Rail-to-rail operation mode is available when the OA module is used to buffer the CTSD16 inputs. For more information, see the CTSD16 and the OA modules in the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

7.2.1.4 Detailed Design Procedure

7.2.1.4.1 OSR and Sampling Frequency

A simple equation guides the relationship between effective sampling frequency and oversampling ratio (OSR) for CTSD16.

$$f_s = \frac{f_m}{\text{OSR}} \quad (2)$$

Where

- f_s = effective sampling frequency
- f_m = modulation frequency

For the CTSD16, the modulation frequency is set to 1.024 MHz. Using [Equation 2](#) with an example OSR of 256, the effective sampling frequency would be 4 kHz. The OSR value also affects the number of bits in the digital filter output. See the CTSD16 chapter in the [MSP430F5xx and MSP430F6xx Family User's Guide](#) for additional information and available OSR values.

7.2.1.4.2 Differential Input Range Explanation

The following equations can give guidance on the input range for the CTSD16 while using an external reference. Keep in mind the absolute bounds of an external reference as mentioned in the specifications section of this module. The external and internal references cannot be used at the same time, because they share the same signal path and pin. For internal reference ranges, see [Section 5.8.11](#).

$$V_{\text{FSR}+} = \frac{+V_R}{\text{GAIN}} \quad (3)$$

$$V_{\text{FSR}-} = \frac{-V_R}{\text{GAIN}} \quad (4)$$

$$\text{Full-Scale Range} = V_{\text{FSR}+} - V_{\text{FSR}-} = 2 \times \frac{V_R}{\text{GAIN}} \quad (5)$$

$$V_{\text{ID}} = 0.8 V_{\text{FSR}-} \text{ to } 0.8 V_{\text{FSR}+}, \text{ with externally sourced } V_R \quad (6)$$

Where

- V_{FSR} is the full-scale range voltage
- V_{ID} is the differential input voltage
- V_R is the reference voltage

The differential input voltage range with internal voltage reference at different GAIN settings is given in [Section 5.8.11](#). Using [Equation 3](#) through [Equation 6](#), determine the absolute maximum differential input ranges for the CTSD16 with a given external voltage reference. [Equation 7](#) corresponds to the example circuit in [Figure 7-6](#) and can be used after a range is chosen to limit differential input voltage to acceptable levels by solving for the external resistors R1 and R2.

$$V_{in} = V_m \times \frac{R_2}{R_2 + 2R_1} \times \frac{1}{1 + \frac{R_{eff}}{2R_{in}}} \quad (7)$$

Where

- $R_{eff} = (R_2 \times 2R_1) / (R_2 + 2R_1)$
- V_{in} is the differential voltage input to CTSD16
- V_m is the voltage to measure
- R_{in} is the internal resistance of the CTSD16 (see [Section 5.8.11](#))

7.2.1.4.3 Single-Ended Input Mode

The CTSD16 has six single-ended analog inputs and four differential inputs that can be placed in single-ended mode by the CTSDINCHx bits in the CTSD16INCTLx registers. These single-ended modes use the fully differential path of the CTSD16 by internally tying the negative input to the V_{REFBG}/V_{eREF+} signal. This means for the differential inputs in single-ended mode, the external pin normally tied to the negative input can be used for its alternate functions. [Equation 8](#) through [Equation 11](#) apply for full-scale range while in single-ended mode.

$$V_{FSR+} = V_R + \frac{V_R}{GAIN} \quad (8)$$

$$V_{FSR-} = V_R - \frac{V_R}{GAIN} \quad (9)$$

$$\text{Full-Scale Range} = V_{FSR+} - V_{FSR-} = \left(V_R + \frac{V_R}{GAIN} \right) - \left(V_R - \frac{V_R}{GAIN} \right) = 2 \times \frac{V_R}{GAIN} \quad (10)$$

$$V_I = V_R - 0.8 \times \left(\frac{V_R}{GAIN} \right) \text{ to } V_R + 0.8 \times \left(\frac{V_R}{GAIN} \right) \quad (11)$$

Where

- V_{FSR} is the full-scale range voltage
- V_I is the single-ended input voltage range for data-sheet specified performance
- V_R is the reference voltage

To ensure the measured voltage is within the single-ended voltage range, a simple voltage divider circuit can be used to condition the desired input signal. In single-ended mode, additional error may be introduced by noise when compared to a fully differential measurement. [Equation 12](#) corresponds to the example circuit in [Figure 7-7](#) and can be used after a range is chosen to limit differential input voltage to acceptable levels by solving for the external resistors R1 and R2.

$$V_{in} = V_m \times \frac{R_2}{R_1 + R_2} \quad (12)$$

Where

- V_{in} is the single-ended voltage input to CTSD16
- V_m is the voltage to measure

7.2.1.4.4 Offset Calibration

In some applications, it is necessary to calibrate the module for offset error. This module allows an easy way to do this by providing internal connections from input to VREF or DAC0. To short AD4+ and AD4- to VREF or DAC0, change the CTSD16INCHx setting for each channel to 0x11 for VREF and 0x12 for DAC0. This allows calibration of the CTSD16 input stage by what is measured from the ideal value. The total signal chain offset depends on the impedance of the external circuitry; thus, the actual offset seen at any of the analog inputs may be different.

7.2.1.5 Layout Guidelines

Components that are shown in the partial schematic (see [Figure 7-5](#)) should be placed as close as possible to the respective device pins. Avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

The analog differential input signals must be routed closely together to minimize the effect of noise on the resulting signal.

7.2.2 Operational Amplifier With Ground Switches Peripheral

For internal connections between signal chain modules such as CTSD16, OA, and DAC12, see [Section 6.12.16](#). When internal connections are available, they should be chosen over external connections to reduce noise and save pins.

Solid decoupling on both the digital and analog supplies is also required (best with two capacitors, one 1 μ F and one 100 nF [see [Section 7.1.1](#)]).

7.2.2.1 Reference Schematic

- A. The capacitor on CPCAP is required when the charge pump is enabled. The charge pump can be enabled by rail-to-rail operation of the PGA buffers of the CTSD16 or by the OA module. See the register settings for each module in the [MSP430F5xx and MSP430F6xx Family User's Guide](#) for enabling this operation.

Figure 7-8. Op Amp Partial Schematic

7.2.2.2 Design Requirements

As with any analog signals, appropriate printed-circuit-board layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

In addition to grounding, ripple and noise spikes on the power-supply lines due to digital switching or switching power supplies can corrupt the signal. TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy. For more information about noise and its effects on op amps, see [Noise Analysis in Operational Amplifiers](#).

Rail-to-rail operation mode is available with the OA module at the cost of increased current. This should be used when OA input is near the AVCC rail. See the V_{CM} specification (see [Section 5.8.14](#)) to see if rail-to-rail operation is required for your application. For more information, see the OA chapter of the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

Ground switches are also available for use. See [Section 6.12.16](#) for connections. These ground switches provide a low-ohmic connection to ground to both internal connections and to the external pin. When a ground switch is active, the Digital I/O logic for the corresponding pin is ignored.

7.2.2.3 Detailed Design Procedure

Operational amplifiers are a diverse and useful tool in many applications. Some common configurations that might prove to be useful to the user are transimpedance amplifiers to convert currents to voltage, voltage-gain amplifiers, and buffering configurations. For more information about how to design these circuits along with other common configurations, see the following documents.

- *Op Amps for Everyone* (ISBN: 978-0128116487)
- [Handbook of Operational Amplifier Applications](#)
- [Understanding Basic Analog – Ideal Op Amps](#)
- [An Applications Guide for Op Amps](#)

7.2.2.4 Layout Guidelines

Components that are shown in the partial schematic (see [Figure 7-8](#)) should be placed as close as possible to the respective device pins. Avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal. Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal. When possible, use internal connections to other modules to limit the potential of error introduction.

7.2.3 RTC_B With Battery Backup System

If not using a separate battery backup supply in the system, see [Section 4.6](#) for VBAT and VBAK connections.

7.2.3.1 Partial Schematic

- A. BAT can be a battery or super-capacitor. See [Section 5.8.8](#) for specifications.

Figure 7-9. RTC_B With Battery Backup Partial Schematic

7.2.3.2 Retaining an Accurate Real-Time Clock (RTC) Through Main Supply Interruptions

The RTC_B module with Battery Backup System is designed to keep an accurate RTC during main supply interruptions and during low-power modes. For more details on when the Backup Battery System engages, see the Battery Backup System chapter in the [MSP430F5xx and MSP430F6xx Family User's Guide](#). See [Using the MSP430 RTC_B Module With Battery Backup Supply](#) for more information and example code on how to keep an accurate RTC through power loss.

7.2.3.3 Charging Super-Capacitors With Built-In Resistive Charger

In applications that use a super-capacitor instead of a battery for secondary supply, the charging circuit functionality of the Battery Backup System can be used to charge the super-capacitor. The resistive charger circuit connects VBAT to DVCC with selectable resistor values found in [Section 5.8.8](#). This means that if DVCC is not present, you cannot use this feature to charge a super-capacitor connected to VBAT. The CTSD16 module can be used to sense the voltage level on VBAT divided by a factor of three. Typical values during VBAT sensing are listed in [Section 5.8.8](#). Channel A8 of the CTSD16 is routed internally for this. See the CTSD16 chapter of the [MSP430F5xx and MSP430F6xx Family User's Guide](#) for more information. The BAKADC bit in the BAKCTL register must also be enabled for this feature to operate.

Additionally, RTC interrupts can be used to wake up from LPMx.5 states to charge the super-capacitor. While in an LPMx.5 state, the super-capacitor on VBAT drains. This means that the "wake to charge" interrupt interval must be designed so that charging starts before the leftover charge in the super-capacitor is too small to accommodate the worst-case backup time if the system were to suddenly lose power. To estimate this time, use [Equation 13](#) for capacitor discharge in an RC circuit.

$$V(t) = V_0 e^{-\frac{t}{RC}} \quad (13)$$

Where

- V_0 = initial voltage of capacitor
- t = time
- R = circuit resistance
- C = capacitance

Because the operational current is given for when RTC is operating within the specifications section, R can be replaced with $V_0/I_{LPM3.5}$ by Ohm's law. By setting $V(t)$ to the minimum voltage for RTC operation while in backup supply, V_0 as voltage of capacitor when fully charged, and C as the super-capacitor capacitance, the estimated RTC operation time can be calculated. If periodic wakeups from LPM3.5 are not desirable for a given application, external means of charging the super-capacitor must be implemented by the user.

For a detailed list of when the secondary supply VBAT powers the backup-supplied subsystem, see the Battery Backup System chapter in the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

7.2.4 LCD_B Peripheral

7.2.4.1 Partial Schematic

Required LCD connections greatly vary by the type of display that is used (static or multiplexed), whether external or internal biasing is used, and also whether the on-chip charge pump is employed. For any display used, there is flexibility as to how the segment (Sx) and common (COMx) signals are connected to the MCU which (assuming that the correct choices are made) can be advantageous for the PCB layout and for the design of the application software.

Because LCD connections are application specific, it is difficult to provide a single one-fits-all schematic. However for an example of a schematic using the LCD_B module with an MSP430F6638, see the [Ultra Low Power Blood Pressure And Heart Rate Monitor Reference Design](#).

7.2.4.2 Design Requirements

Due to the flexibility of the LCD_B peripheral module to accommodate various segment-based LCDs, selecting the right display for the application in combination with determining specific design requirements is often an iterative process. There can be well-defined requirements in terms of how many individually addressable LCD segments need to be controlled, what the requirements for LCD contrast are, which device pins are available for LCD use and which are required by other application functions, and what the power budget is, to name just a few. TI strongly recommends reviewing the LCD_B peripheral module chapter in the [MSP430F5xx and MSP430F6xx Family User's Guide](#) during the initial design requirements and decision process. The following table provides a brief overview over different choices that can be made and their impact.

OPTION OR FEATURE	IMPACT OR USE CASE
Multiplexed LCD	<ul style="list-style-type: none"> • Enable displays with more segments • Use fewer device pins • LCD contrast decreases as mux level increases • Power consumption increases with mux level • Requires multiple intermediate bias voltages
Static LCD	<ul style="list-style-type: none"> • Limited number of segments that can be addressed • Use a relatively large number of device pins • Use the least amount of power • Use only V_{CC} and GND to drive LCD signals
Internal Bias Generation	<ul style="list-style-type: none"> • Simpler solution – no external circuitry • Independent of V_{LCD} source • Somewhat higher power consumption
External Bias Generation	<ul style="list-style-type: none"> • Requires external resistor ladder divider • Resistor size depends on display • Ability to adjust drive strength to optimize tradeoff between power consumption and good drive of large segments (high capacitive load) • External resistor ladder divider can be stabilized through capacitors to reduce ripple
Internal Charge Pump	<ul style="list-style-type: none"> • Helps ensure a constant level of contrast despite decaying supply voltage conditions (battery-powered applications) • Programmable voltage levels allow software-driven contrast control • Requires an external capacitor on the LCD_{CAP} pin • Higher current consumption than simply using V_{CC} for the LCD driver

7.2.4.3 Detailed Design Procedure

A major component in designing the LCD solution is determining the exact connections between the LCD_B peripheral module and the display itself. Two basic design processes can be employed for this step, although in reality often a balanced co-design approach is necessary:

- PCB layout-driven design
- Software-driven design

In the PCB layout-driven design process, the segment S_x and common COM_x signals are connected to respective MSP430 device pins so that the routing of the PCB can be optimized to minimize signal crossings and to keep signals on one side of the PCB only, typically the top layer. For example, using a multiplexed LCD, it is possible to arbitrarily connect the S_x and COM_x signals between the LCD and the MSP430 device as long as segment lines are swapped with segment lines and common lines are swapped with common lines. It is also possible to not contiguously connect all segment lines but rather skip LCD_B module segment connections to optimize layout or to allow access to other functions that may be multiplexed on a particular device port pin. Employing a purely layout-driven design approach, however, can result in the LCD_B module control bits that are responsible for turning on and off segments to appear scattered throughout the memory map of the LCD controller (LCD_{Mx} registers). This approach potentially places a rather large burden on the software design that may also result in increased energy consumption due to the computational overhead required to work with the LCD.

The other extreme is a purely software-driven approach that starts with the idea that control bits for LCD segments that are frequently turned on and off together should be co-located in memory in the same LCD_{Mx} register or in adjacent registers. For example, in case of a 4-mux display that contains several 7-segment digits, from a software perspective it can be very desirable to control all 7 segments of each digit though a single byte-wide access to an LCD_{Mx} register. And consecutive segments are mapped to consecutive LCD_{Mx} registers. This allows use of simple look-up tables or software loops to output numbers on an LCD, reducing computational overhead and optimizing the energy consumption of an application. Establishing the most convenient memory layout must be performed in conjunction with the specific LCD that is being used to understand its design constraints in terms of which segment and which common signals are connected to, for example, a digit.

For design information regarding the LCD controller input voltage selection including internal and external options, contrast control, and bias generation, refer to the LCD_B controller chapter in the [MSP430F5xx and MSP430F6xx Family User's Guide](#).

For additional design information, see [Designing With MSP430 and Segment LCD](#).

7.2.4.4 Layout Guidelines

LCD segment (Sx) and common (COMx) signal traces are continuously switching while the LCD is enabled and should, therefore, be kept away from sensitive analog signals such as ADC inputs to prevent any noise coupling. TI recommends keeping the LCD signal traces on one side of the PCB grouped together in a bus-like fashion. A ground plane underneath the LCD traces and guard traces employed alongside the LCD traces can provide shielding.

If the internal charge pump of the LCD module is used, the externally provided capacitor on the LCDCAP pin should be located as close as possible to the MCU. The capacitor should be connected to the device using a short and direct trace and also have a solid connection to the ground plane that is supplying the V_{SS} pins of the MCU.

For an example layout of the LCD_B module with an MSP430F6638, see the [Ultra Low Power Blood Pressure And Heart Rate Monitor Reference Design](#).

7.2.5 DAC12 Peripheral

For internal connections between signal chain modules such as CTSD16, OA, and DAC12, see [Section 6.12.16](#). When available, internal connections should be chosen over external ones to reduce noise and save pins.

Solid decoupling on both the digital and analog supplies is required (best with two capacitors per supply, one 1 μF and one 100 nF [see [Section 7.1.1](#)]).

7.2.5.1 Partial Schematic

NOTE: The capacitor is used to reduce noise when using internal VREFBG setting. This pin is also used for the external reference input for the CTSD16 or DAC. When using the external reference, the capacitor is not needed. Because of the shared signal path and pin, the internal and external references (V_{REFBG} and V_{REF+}, respectively) cannot be used at the same time.

Figure 7-10. DAC12 Partial Schematic

7.2.5.2 Design Requirements

As with any analog signals, appropriate printed-circuit-board layout and grounding techniques must be followed to eliminate ground loops, unwanted parasitic effects, and noise.

In addition to grounding, ripple and noise spikes on the power-supply lines due to digital switching or switching power supplies can corrupt the signal. TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy.

7.2.5.3 Detailed Design Procedure

Digital-to-analog converters (DACs) can be used in a variety of applications and configurations. This section provides some resources for the user to help get started in a design. For details on example DAC applications, see [Bridging the Divide: A DAC Applications Tutorial \(Precision Signal Path\)](#).

Some DAC applications may need an output buffer to reduce the affect of a load on the DAC output. This buffer can be an external op amp or, on some MSP430 devices, the integrated op amp can be used. For more information on how to configure an op amp for this function, see [Section 7.2.2](#).

For more information about DAC applications, see the following application notes:

[High Speed, Digital to Analog Converters Basics](#)

[Design for a Wideband, Differential Transimpedance DAC Output](#)

7.2.5.4 Layout Guidelines

Application circuits attached to the DAC output should be placed as close as possible to the respective device pins. Avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal. Avoid routing analog signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal. When possible, use internal connections to other modules to limit the potential of error introduction.

7.2.6 USB Module

7.2.7 LDO Module

Solid decoupling on both the digital and analog supplies is required (best with two capacitors per supply, one 1 μF and one 100 nF [see [Section 7.1.1](#)]).

The LDO module is in its own power domain on chip (separate from DVCC). To use the Port U pins (PU.0 and PU.1) this domain must be powered. If use of the Port U pins is needed and no voltage is supplied to LDOI, then a 3.3-V supply to LDOO is needed. LDOO can act as an input only when the 3.3-V LDO is not enabled. When the 3.3-V LDO is not needed in applications, keep LDOI tied low to make sure that the LDO module does not draw excessive current when disabled.

7.2.7.1 Partial Schematic

- A. Connection between LDOO and DVCC is optional. If connected, the LDO powers the device. LDOO can also supply other subsystems in the application if the maximum output current for the LDO is not exceeded (see the LDO power system specifications in [Table 5-53](#)).

8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [Figure 8-1](#) provides a legend for reading the complete device name.

MSP-TS430PZ100AUSB - 100-pin Target Development Board for MSP430FG6x MCUs The MSP-TS430PZ100AUSB is a stand-alone 100-pin ZIF socket target board used to program and debug the MSP430 MCU in system through the JTAG interface or the Spy-Bi-Wire (2-wire JTAG) protocol.

Educational BoosterPack MKII The Educational BoosterPack MKII offers a high level of integration for developers to quickly prototype complete solutions. Various analog and digital inputs/outputs are at your disposal including an analog joystick, environmental and motion sensors, RGB LED, microphone, buzzer, color LCD display, and more.

Software

MSP430Ware™ Software MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 design resources, MSP430Ware software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of Code Composer Studio™ IDE or as a stand-alone package.

MSP430FG662x, MSP430FG642x Code Examples C Code examples are available for every MSP device that configures each of the integrated peripherals for various application needs.

MSP Driver Library The abstracted API of MSP Driver Library provides easy-to-use function calls that free you from directly manipulating the bits and bytes of the MSP430 hardware. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

Capacitive Touch Software Library Free C libraries for enabling capacitive touch capabilities on MSP430 MCUs. The MSP430 MCU version of the library features several capacitive touch implementations including the RO and RC method.

MSP EnergyTrace™ Technology EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the energy profile of the application and helps to optimize it for ultra-low-power consumption.

ULP (Ultra-Low Power) Advisor ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully use the unique ultra-low-power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to help minimize the energy consumption of your application. At build time, ULP Advisor provides notifications and remarks to highlight areas of your code that can be further optimized for lower power.

IEC60730 Software Package The IEC60730 MSP430 software package was developed to help customers comply with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

Fixed Point Math Library for MSP The MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

Floating Point Math Library for MSP430 Continuing to innovate in the low-power and low-cost microcontroller space, TI provides MSPMATHLIB. Leveraging the intelligent peripherals of our devices, this floating-point math library of scalar functions that are up to 26 times faster than the standard MSP430 math functions. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio IDE and IAR Embedded Workbench IDE.

Development Tools

Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers Code Composer Studio integrated development environment (IDE) supports all MSP microcontroller devices. Code Composer Studio IDE comprises a suite of embedded software utilities used to develop and debug embedded applications. Code Composer Studio IDE includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features.

MSPWare Software MSPWare software is a collection of code examples, data sheets, and other design resources for all MSP devices delivered in a convenient package. In addition to providing a complete collection of existing MSP design resources, MSPWare software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP hardware. MSPWare software is available as a component of Code Composer Studio IDE or as a stand-alone package.

Command-Line Programmer MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) directly to the MSP microcontroller without an IDE.

MSP MCU Programmer and Debugger The MSP-FET is a powerful emulation development tool – often called a debug probe – which lets users quickly begin application development on MSP low-power MCUs. Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging.

MSP-GANG Production Programmer The MSP Gang Programmer is an MSP430 or MSP432 device programmer that can program up to eight identical MSP430 or MSP432 flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that let the user fully customize the process.

Application Reports

Designing With MSP430 and Segment LCDs Segment liquid crystal displays (LCDs) are needed to provide information to users in a wide variety of applications from smart meters to electronic shelf labels (ESLs) to medical equipment. Several MSP430™ microcontroller families include built-in low-power LCD driver circuitry that allows the MSP430 MCU to directly control the segmented LCD glass. This application note helps explain how segmented LCDs work, the different features of the various LCD modules across the MSP430 MCU family, LCD hardware layout tips, guidance on writing efficient and easy-to-use LCD driver software, and an overview of the portfolio of MSP430 devices that include different LCD features to aid in device selection.

MSP430 32-kHz Crystal Oscillators Selection of the correct crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

MSP430 System-Level ESD Considerations System-Level ESD has become increasingly demanding with silicon technology scaling towards lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three different ESD topics to help board designers and OEMs understand and design robust system-level designs.

Using the MSP430 RTC_B Module With Battery Backup Supply Some applications need to retain an accurate real-time clock (RTC) through battery changes, power outages, and other events. For these applications, MSP430™ devices that contain the RTC_B Real-Time Clock module with a Battery Backup System can be a great fit. This application note demonstrates how to use RTC_B with Battery Backup Supply functionality to retain the time and keep the RTC counting through loss of main power supply, as well as handling correct reinitialization when the main power supply is restored.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

PLASTIC QUAD FLAT PACK

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
- D. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
