GENERAL DESCRIPTION

The Austin Semiconductor SRAM family employs high-speed, low-power CMOS designs using a four-transistor memory cell. Austin Semiconductor SRAMs are fabricated using double-layer metal, double-layer polysilicon technology.

For flexibility in high-speed memory applications, Austin Semiconductor offers chip enable (CE\) on all organizations. This enhancement can place the outputs in High-Z for additional flexibility in system design. The X1 configuration features separate data input and output.

Writing to these devices is accomplished when write enable (WE\) and CE\ inputs are both LOW. Reading is accomplished when WE\ remains HIGH and CE\ goes LOW. The device offers a reduced power standby mode when disabled. This allows system designs to achieve low standby power requirements.

All devices operate from a single +5V power supply and all inputs and outputs are fully TTL compatible.

NOTES

- All voltages referenced to V_{ss} (GND).
- 3V for pulse width < 20ns
- I_{CC} is dependent on output loading and cycle rates. The specified value applies with the outputs unloaded, and $f = \frac{1}{RC (MIN)}$ Hz.
- This parameter is sampled.
- Test conditions as specified with the output loading as shown in Fig. 1 unless otherwise noted.
- t_{HZCE} and t_{HZWE} are specified with CL = 5pF as in Fig. 2. Transition is measured ±500mV typical from steady state voltage, allowing for actual tester RC time constant.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, and t_{HZWE} is less than t_{LZWE}.
- WE\ is HIGH for READ cycle.
- Device is continuously selected. Chip enable is held in its active state.
- Address valid prior to, or coincident with, latest occurring chip enable.
- RC = READ Cycle Time.
- Chip enable (CE\) and write enable (WE\) can initiate and terminate a WRITE cycle.
