

**Features**

- Transformerless 2W to 4W conversion
- Controls battery feed to line
- Programmable line impedance
- Programmable network balance impedance
- Off-hook and dial pulse detection
- Ring ground over-current protection
- Programmable gain
- Programmable constant current feed
- -22V to -72V battery operation

**Applications**

Line interface for:

- PABX/ONS
- Intercoms
- Key Telephone Systems
- Control Systems

DS5057

August 1999

Package Information	
MT91600	28 Pin SSOP Package
<b>-40°C to +85°C</b>	

**Description**

The Mitel MT91600 provides an interface between a switching system and a subscriber loop, mainly for short loop SLIC applications. The functions provided by the MT91600 include battery feed, programmable constant current, 2W to 4W conversion, off-hook and dial pulse detection, user definable line and network balance impedance's and the capability of programming the audio gain externally. The device is fabricated as a CMOS circuit in a 28 pin SSOP package.

**Figure 1 - Functional Block Diagram**

Figure 2 - Pin Connections

Pin Description

Pin #	Name	Description
1	VDD	Positive supply rail, +5V.
2	TD	<b>Tip Drive (Output)</b> . Controls the Tip transistor.
3	TF	<b>Tip Feed</b> . Connects to the Tip transistor and to the TIP lead via the Tip feed resistor.
4	TIP	<b>Tip</b> . Connects to the TIP lead of the telephone line.
5	RING	<b>Ring</b> . Connects to the RING lead of the telephone line.
6	VREF	<b>Reference Voltage (Input)</b> . This pin is used to set the subscribers loop constant current. Changing the input voltage sets the current to any desired value within the working limits. VREF is related to VLC.
7	IC	<b>Internal Connection (Input)</b> . This pin must be connected to GND for normal operation.
8	RF	<b>Ring Feed</b> . Connects to the RING lead via the Ring feed resistor.
9	RV	<b>Ring Voltage and Audio Feed</b> . Connects directly to the Ring drive transistor and also to Ring Feed via a relay.
10	RD	<b>Ring Drive (Output)</b> . Controls the Ring transistor.
11	C3A	A filter capacitor for over-current protection is connected between this pin and GND.
12	C3B	A filter capacitor for over-current protection is connected between this pin and GND.
13	C2B	A capacitor for loop current stability is connected between this pin and C2A.
14	C2A	A capacitor for loop current stability is connected between this pin and C2B.
15	Z1	<b>Line Impedance Node 1</b> . A resistor of scaled value "k" is connected between Z1 and Z2. This connection can not be left open circuit.
16	Z2	<b>Line Impedance Node 2</b> . This is the common connection node between Z1 and Z3.
17	Z3	<b>Line Impedance Node 3</b> . A network either resistive or complex of scaled value "k" is connected between Z3 and Z2. This connection can not be left open circuit.
18	X1	<b>Gain Node 1</b> . This is the common node between Z3 and VX where resistors are connected to set the 2W to 4W gain.
19	VX	<b>Transmit Audio (Output)</b> . This is the 4W analog signal to the SLIC.
20	X3	<b>Gain Node 3</b> . This is the common node between VR and the audio input from the CODEC or switching network where resistors are fitted to sets the 4W to 2W gain
21	VR	<b>Receive Audio (Input)</b> . This is the 4W analog signal to the SLIC.

**Pin Description (continued)**

Pin #	Name	Description
22	X2	<b>Gain Node 2.</b> Networks, either resistive or complex, are connected between this node, VR and GND to set the Network Balance Impedance for the SLIC.
23	C1	A filter capacitor for ring trip is connected between this pin and GND.
24	SHK	<b>Switch Hook (Output).</b> This pin indicates the line state of the subscribers telephone. The output can also be used for dial pulse monitoring. SHK is high in off-hook state.
25	RLYC	<b>Relay Control (Input).</b> An active high on this pin will switch RLYD low.
26	RLYD	<b>Inverted Output of RLYC.</b> It is used to drive the bipolar transistor that drives the relay (see Figure 5.)
27	GND	<b>Ground. Return path for +5V and -5V.</b> This should also be connected back to the return path for the loop battery, LGND and relay drive ground RLYGND.
28	VEE	Negative supply rail, -5V.

**Functional Description**

The MT91600 is the analog SLIC for use in a 4 Wire switched system. The SLIC performs all of the normal interface functions between the CODEC or switching system and the analog telephone line such as 2W to 4W conversion, constant current feed, ringing and ring trip detection, current limiting, switch hook indication and line and network balance impedance setting using minimal external components.

Refer to Figure 5 for MT91600 components designation.

**2 Wire to 4 Wire Conversion**

The hybrid performs 2 wire to 4 wire conversion by taking the 4 wire signal from an analog switch or voice CODEC, a.c. coupled to  $V_R$ , and converting it to a 2 wire differential signal at tip and ring. The 2 wire signal applied to tip and ring by the telephone is converted to a 4 wire signal, a.c. coupled to  $V_x$  which is the output from the SLIC to the analog switch or voice CODEC.

**Gain Control**

It is possible to set the Transmit and Receive gains by the selection of the appropriate external components.

The gains can be calculated by the formulae:

2W to 4W gain:

$$\text{Gain } 2 - 4 = 20 \cdot \text{Log} [ R13 / R12 ]$$

4W to 2W gain:

$$\text{Gain } 4 - 2 = 20 \cdot \text{Log} [ 0.891 * ( R14 / R15 ) ]$$

**Impedance Programming**

The MT91600 allows the designer to set the device's impedance across TIP and RING, ( $Z_{TR}$ ), and network balance impedance, ( $Z_{NB}$ ), separately with external low cost components.

For a resistive load, the impedance ( $Z_{TR}$ ) is set by R11 and R18. For a complex load, the impedance ( $Z_{TR}$ ) is set by R11, R18, R19 & C8 (see Figure 5.)

The network balance, ( $Z_{NB}$ ), is set by R16, R17 & C3 (see Figure 5.)

The network balance impedance should be calculated once the 2W - 4W gain has been set.

**Line Impedance**

For optimum performance, the characteristic impedance of the line, ( $Z_o$ ), and the device's impedance across TIP and RING, ( $Z_{TR}$ ), should match. Therefore:

$$Z_o = Z_{TR}$$

The relationship between  $Z_o$  and the components that set  $Z_{TR}$  is given by the formula:

$$Z_o / ( R1+R2 ) = kZ_o / R11$$

where  $kZ_o = Z_{LZ}$

$$Z_{LZ} = R18, \text{ for a resistive load.}$$

$$Z_{LZ} = [ R18 + ( R19 // C8 ) ], \text{ for a complex load.}$$

The value of k can be set by the designer to be any value between 20 and 250. Three rules to ensure the correct operation of the circuit:

- (A)  $R18 + R19 > 50k\Omega$
- (B)  $R1 = R2$ .
- (C)  $R11 > =50k\Omega$

It is advisable to place these components as close as possible to the SLIC.

## Network Balance Impedance

The network balance impedance, ( $Z_{NB}$ ), will set the transhybrid loss performance for the circuit. The balance of the circuit is independent of the 4 - 2 Wire gain but is a function of the 2 - 4 Wire gain.

The method of setting the values for R16 and R17 is given by the formula:

$$\frac{R17}{R17 + R16} = \frac{[1.782 * Z_o / (Z_o + Z_{NB}) * (R13 / R12)]}{[1 + R13 / R12]}$$

where  $Z_{NB}$  is the network balance impedance of the SLIC and  $Z_o$  is the line impedance.

$$(R16 + R17) \geq 50k\Omega$$

It is advisable to place these components as close as possible to the SLIC.

## Loop Supervision & Dial Pulse Detection

The Loop Supervision circuit monitors the state of the phone line and when the phone goes "Off Hook" the SHK pin goes high to indicate this state. This pin reverts to a low state when the phone goes back "On Hook" or if the loop resistance is too high for the circuit to continue to support a constant current.

The SHK output can also be monitored for dialing information when used in a dial pulse system.

## Constant Current Control

The SLIC employs a feedback circuit to supply a constant feed current to the line. This is done by sensing the sum of the voltages across the feed resistors, R1 and R2, and comparing it to the input reference voltage,  $V_{ref}$ , that determines the constant current feed current.

The MT91600's programmable current range is between 18mA to 32mA.

## Line Drivers & Overcurrent Protection

The Line Drivers control the external Battery Feed circuit which provide power to the line and allows bi-directional audio transmission.

The loop supervision circuitry provides bias to the line drivers to feed a constant current while the over-current protection circuitry prevents the ring driver from causing the ring transistor to overload.

The line impedance presented by the Line Driver circuitry is determined by the external network, which may be purely resistive or complex, allowing the circuit to be configured for use in any application. The impedance can also be fixed to one value and modified to look like a different value by reflecting an impedance through the SLIC from an intelligent CODEC or DSP module.

There is long term protection on the RING output against accidental short circuits that may be applied either across TIP/RING to GND or RING to GND. This high current will be sensed and limited to a value that will protect the circuit.

In situations where an accidental short circuit occurs either across TIP/RING to GND or RING to GND, an excessive amount of current will flow through the ring drive transistor, Q3. Although the MT91600 will sense this high current and limit it, if the power rating of Q3 is not high enough, it may suffer permanent damage. In this case, a power sharing resistor, R23, can be inserted (see Figure 5) to dissipate some of the power. Capacitor C13 is inserted to provide an a.c. ground point. The criteria for selecting a value for the power sharing resistor R23 can be found in the application section of this datasheet.

## Ringling and Ring Trip Detection

Ringling is applied to the line by disconnecting pin 8, RF, from pin 9, RV, and connecting it to a ringling source which is battery backed. This may be done by use of an electro-mechanical relay. The SLIC is capable of detecting an Off Hook condition during ringling by filtering out the large A.C. component by use of the external components connected to pin 23. This filter allows an Off Hook condition to be monitored at SHK, pin 24.

When using DTMF signalling only i.e. pulse dialling is not used, the capacitor, C7, can be permanently connected to ground and does not require to be switched out during dialling.

### Power up Sequence

The circuit should be powered up in the following order: AGND, VEE, VDD, V<sub>BAT</sub>.

### Application

The following Application section is intended to demonstrate to the user the methods used in calculating and selecting the external programming components in implementing the MT91600 as an analog line interface in a communication system. The programming component values calculated below results in the optimum performance of the device.

Refer to Figure 5 for MT91600 components designation.

### Component Selection

#### Feed Resistors (R1, R2)

The selection of feed resistors, R1 and R2, can significantly affect the performance of the MT91600. It is recommended that their values fall in the range of:

$$200\Omega \leq R1 \leq 250\Omega$$

where, R1 = R2

The resistors should have a tolerance of 1% (0.15% matched) and a power rating of 1 Watt.

#### Loop Current Setting (R3, R4, C9)

By using a resistive divider network, (Figure 3), it is possible to maintain the required voltage at V<sub>ref</sub> to set I<sub>LOOP</sub>. The loop current programming is based on the following relationship:

$$I_{LOOP} = - \frac{[ F * V_{LC} + G * V_{BAT} ] * K_o * H}{(R1 + R2)}$$

where, F = R4 / (R4 + R3)  
 G = R3 / (R4 + R3)  
 K<sub>o</sub> = 200000 / (200000 + (R4//R3) )  
 H = 1.07  
 I<sub>LOOP</sub> is in Ampere

From Figure 3 with R1 = R2 = 220Ω

For I<sub>LOOP</sub> = 25mA, V<sub>LC</sub> = 0V, V<sub>bat</sub> = -48V

Figure 3 - Resistor Divider

C9 is inserted to ensure pin 6, V<sub>ref</sub>, remains at a.c. ground. 100nF is recommended.

I<sub>LOOP</sub> can also be set by directly driving V<sub>ref</sub> with a low impedance voltage source. (See Figure 4). It is recommended that a small resistor be placed in series with the V<sub>ref</sub> pin. In this case:

$$I_{LOOP} = \frac{1.07 * V_s}{(R1 + R2)} \quad \text{where, } V_s < 0$$

Figure 4 - Direct Voltage

### Calculating Component Values For AC Transmission

There are five parameters a designer should know before starting the component calculations. These five parameters are:

- 1) characteristic impedance of the line Z<sub>o</sub>
- 2) network balance impedance Z<sub>NB</sub>
- 3) value of the feed resistors (R1 and R2)
- 4) 2W to 4W transmit gain
- 5) 4W to 2W receive gain

The following example will outline a step by step procedure for calculating component values. Given:

$$Z_o = 600\Omega, Z_{NB} = 600\Omega, R1=R2= 220\Omega$$

$$\text{Gain } 2 - 4 = -1\text{dB}, \text{ Gain } 4 - 2 = -1\text{dB}$$

**Step 1: Gain Setting (R12, R13, R14, R15)**

$$\text{Gain } 2 - 4 = 20 \text{ Log } [ R13 / R12]$$

$$-1 \text{ dB} = 20 \text{ Log } [R13 / R12]$$

$$\therefore R12 = 112.2\text{k}\Omega, R13 = 100\text{k}\Omega$$

$$\text{Gain } 4 - 2 = 20 \text{ Log } [0.891 * [R14 / R15]]$$

$$-1 \text{ dB} = 20 \text{ Log } [0.891 * [R14 / R15]]$$

$$\therefore R14 = 100\text{k}\Omega, R15 = 100\text{k}\Omega$$

**Step 2: Impedance Matching (R11, R18, R19, C8)**

a)  $Z_o / ( R1+R2) = kZ_o / R11$

$$600/(220+220) = (k*600)/R11$$

let  $k = 125$

$$\therefore R11 = 55\text{k}\Omega.$$

b) In general,

$$kZ_o = Z_{LZ}$$

where:

$$Z_{LZ} = R18, \text{ for a resistive load.}$$

$$Z_{LZ} = [R18 + (R19 // C8)], \text{ for a complex load.}$$

Since we are dealing with a resistive load in this example  $Z_{LZ} = R18$ , and therefore:

$$kZ_o = R18$$

$$(125 * 600) = R18$$

$$\therefore R18 = 75\text{k}\Omega.$$

**Step 3: Network Balance Impedance (R16, R17)**

$$\frac{R17}{R17 + R16} = \frac{[1.782 * Z_o / ( Z_o + Z_{NB}) * ( R13 / R12 )]}{[1 + R13 / R12]}$$

$$\frac{R17}{R17 + R16} = 0.4199$$

set  $R17 = 100\text{k}\Omega$ ,  $R16$  becomes  $138\text{k}\Omega$ .

$$\therefore R16 = 138\text{k}\Omega, R17 = 100\text{k}\Omega$$

**Complex Line Impedance,  $Z_o$**

In situations where the characteristic impedance of the line  $Z_o$  is a complex value, determining the component values for impedance matching ( $R11, R18, R19, C8$ ) is as follows:

$$\text{Given } Z_o = 220\Omega + (820\Omega // 120\text{nF})$$

$$Z_o / ( R1+R2) = kZ_o / R11 \quad \text{(Equation 1)}$$

$$\text{where, } kZ_o = [R18 + (R19 // C8)]$$

Choose a standard value for  $C8$  to find a suitable value for  $k$ .

Since  $1\text{nF}$  exists, let  $C8 = 1\text{nF}$  then,

$$k = 120\text{nF} / C8$$

$$k = 120\text{nF} / 1\text{nF}$$

$$\therefore k = 120$$

$$R18 = k * 220\Omega$$

$$R18 = 120 * 220\Omega$$

$$R18 = 26400$$

$$R19 = k * 820\Omega$$

$$R19 = 120 * 820$$

$$R19 = 98400$$

$$\therefore R18 = 26\text{k}4\Omega, R19 = 98\text{k}4\Omega$$

From (Equation 1)

$$R11 = k * (R1 + R2)$$

$$R11 = 120 * (220\Omega + 220\Omega)$$

$$\therefore R11 = 52\text{k}8\Omega$$

**Power Sharing Resistor (R23)**

To determine the value of  $R23$ , use the following equations:

$$R23(\text{max}) = \frac{|V_{\text{bat}}(\text{min})| - 100 - (2 * R2 + L_r + \text{DCRP})}{30\text{mA}}$$

$$R23(\text{min}) = \frac{|V_{\text{bat}}(\text{max})| - P_d(\text{max}) - R2}{40\text{mA} \quad 1.6\text{mA}}$$

where,

$V_{\text{bat}}(\text{min}/\text{max})$  = the expected variation of  $V_{\text{bat}}$ .

$R2$  = the feed resistor.

$L_r$  = maximum DC loop resistance.

$\text{DCRP}$  = DC resistance of the phone set.

$P_d(\text{max})$  = the maximum power dissipation of the ring drive transistor  $Q3$ .

If  $R23(\text{max}) > R23(\text{min})$ , then set  $R23$  to be the geometric center:

$$R23 = \text{Square Root } (R23(\text{max}) * R23(\text{min}))$$

If  $R_{23}(\max) < R_{23}(\min)$ , then a violation has occurred.  $P_d(\max)$  will have to be increased.

**A numerical example:**

Given:

$$R_2 = 220\Omega$$

$L_r = 325\Omega$  (2.5km of 28 gauge wire, averaged at  $65\Omega/\text{km}$ )

$$DCRP = 200\Omega$$

$$P_d(\max) = 1.5W$$

$$V_{bat} = -48V \pm 10\% \text{ (i.e. } -43V \text{ to } -53V)$$

Therefore:

$$\begin{aligned} R_{23}(\max) &= (43/30\text{mA}) - 100 - (2 * 220 + 325 + 200) \\ &= 1433.3 - 100 - 965 \end{aligned}$$

$$R_{23}(\max) = 368.3\Omega$$

$$\begin{aligned} R_{23}(\min) &= (53/40\text{mA}) - (1.5/1.6\text{mA}) - 220 \\ &= 1325 - 937.5 - 220 \end{aligned}$$

$$R_{23}(\min) = 167.5 \Omega$$

$$R_{23} = \text{Square Root} ( 368.3 * 167.5 )$$

$$R_{23} = 248.4\Omega$$

Figure 5 - Typical application

**Component List\* for a Typical Application with a Resistive 600Ω Line Impedance** - Refer to Figure 5 for component designation and recommended configuration

Resistor Values			
R1	220Ω 1% (0.15% matched), 1W	R2	220Ω 1% (0.15% matched), 1W

Note: All resistors are 1/4 W, 1% unless otherwise indicated.

\*Assumes  $Z_o = Z_{NB} = 600\Omega$ , Gain 2 - 4 = -1dB, Gain 4 - 2 = -1dB.

Decoupling capacitors, (1uF, 100V, 20%), can be added to  $V_{DD}$ ,  $V_{EE}$ ,  $V_{BAT}$  and  $V_{RLY}$  to provide improved PSRR performance.

K1 = Electro-mechanical relay, 5V, DPDT/2 FORM C

PR1 = This device must always be fitted to ensure damage does not occur from inductive loads. For simple applications, PR1 can be replaced by a single TVS, such as 1.5KE220C, across tip and ring. For applications requiring lightning and mains cross protection further circuitry will be required and the following protection devices are suggested: P2353AA, P2353AB (Teccor), THBT20011, THBT20012, THBT200S (SGS-Thomson), TISP2290, TSSP8290L (T.I.)

**Absolute Maximum Ratings\***

	Parameter	Sym	Min	Max	Units	Comments
1	DC Supply Voltages	V <sub>DD</sub> V <sub>EE</sub> V <sub>BAT</sub>	-0.3 -6.5 -80	+6.5 +0.3 +0.3	V V V	Limited by the Drive transistor, Q3.

8	Return Loss at 2-Wire	RL	20	30		dB	Note 6 300Hz - 3400Hz Test circuit as Fig. 10
9	Total Harmonic Distortion @2W @VX	THD		0.3 0.3	1.0 1.0	% %	3dBm, 1kHz @ 2W 1Vrms, 1KHz @ 4W
10	Common Mode Rejection 2 wire to Vx	CMR	35	42		dB	Input 0.5Vrms, 1KHz Test circuit as Fig. 9
11	Longitudinal to Metallic Balance	LCL		55		dB	200Hz to 3400Hz Test circuit as Fig. 9
12	Metallic to Longitudinal Balance			58 48		dB dB	200Hz to 1000Hz 1000Hz to 3400Hz
13	Idle Channel Noise @2W @VX	Nc			12 12	dBrnC dBrnC	Cmessage Filter Cmessage Filter
14	Power Supply Rejection Ratio at 2W and VX Vdd Vee	PSRR		23 23		dB dB	0.1Vp-p @ 1kHz

†Electrical Characteristics are over Recommended Operating Conditions unless otherwise stated.

‡Typical figures are at 25°C with nominal +5V and are for design aid only.

Note 6: Assumes  $Z_o = Z_{NB} = 600\Omega$  and both transmit and receive gains are programmed externally to -1dB, i.e. Gain 2-4 = -1dB, Gain 4-2 = -1dB.

## Mechanical Information

Refer to the latest copy of the Mitel data book for details of the outline for the 28 Pin SSOP package.

Test Circuits

Figures 6,7,8,9,10 are for illustrating the principles involved in making measurements and do not necessarily reflect the actual method used in production testing.
