Logic Level TMOS (L²TMOS™) E-FET™

Power Field Effect Transistor

N-Channel Enhancement-Mode Silicon Gate

This advanced E-FET is an L²TMOS power MOSFET designed to withstand high energy in the avalanche and commutation modes. This device is also designed with a low threshold voltage so it is fully enhanced with 5.0 Volts. This new energy efficient device also offers a drain-to-source diode with a fast recovery time. Designed for low voltage, high speed switching applications in power supplies, converters and PWM motor controls, these devices are particularly well suited for bridge circuits where diode speed and commutating safe operating areas are critical and offer additional safety margin against unexpected voltage transients.

- Avalanche Energy Specified
- Low Drive Requirement to Interface Power Loads to Logic Level ICs or Microprocessors — $V_{GS(th)} = 2.0$ Volts Max
- Commutating Safe Operating Area (CSOA) Specified for Use in Half and Full Bridge Circuits
- Source-to-Drain Diode Recovery Time Comparable to a Discrete Fast Recovery Diode
- Diode is Characterized for Use in Bridge Circuits
- I_{DSS} , $V_{GS(th)}$ and $V_{DS(on)}$ Specified at Elevated Temperature

MTP30N06EL

Motorola Preferred Device

TMOS POWER FET
LOGIC LEVEL
30 AMPERES
 $R_{DS(on)} = 0.05$ OHM
60 VOLTS

CASE 221A-06, Style 5
TO-220AB

MAXIMUM RATINGS ($T_C = 25^\circ\text{C}$ unless otherwise noted)

Rating	Symbol	Value	Unit
Drain-to-Source Voltage	V_{DSS}	60	Volts
Drain-to-Gate Voltage ($R_{GS} = 1.0$ M Ω)	V_{DGR}	60	Volts
Gate-to-Source Voltage — Continuous	V_{GS}	± 15	Volts
Drain Current — Continuous	I_D	30	Adc
— Continuous @ 100°C	I_D	22	
— Single Pulse ($t_p \leq 10$ μs)	I_{DM}	120	Apk
Total Power Dissipation	P_D	100	Watts
Derate above 25°C		0.67	W/ $^\circ\text{C}$
Operating and Storage Temperature Range	T_J, T_{stg}	-55 to 175	$^\circ\text{C}$
Single Pulse Drain-to-Source Avalanche Energy — Starting $T_J = 25^\circ\text{C}$ ($V_{DD} = 25$ Vdc, $V_{GS} = 5.0$ Vpk, $I_L = 30$ Apk, $L = 0.49$ mH, $R_G = 25$ Ω)	EAS	220	mJ
Thermal Resistance — Junction to Case	$R_{\theta JC}$	1.5	$^\circ\text{C}/\text{W}$
— Junction to Ambient	$R_{\theta JA}$	62.5	
Maximum Lead Temperature for Soldering Purposes, 1/8" from case for 10 seconds	T_L	260	$^\circ\text{C}$

Designer's Data for "Worst Case" Conditions — The Designer's Data Sheet permits the design of most circuits entirely from the information presented. SOA Limit curves — representing boundaries on device characteristics — are given to facilitate "worst case" design.

Preferred devices are Motorola recommended choices for future use and best overall value.

SAFE OPERATING AREA INFORMATION

FORWARD BIASED SAFE OPERATING AREA

The FBSOA curves define the maximum drain-to-source voltage and drain current that a device can safely handle when it is forward biased, or when it is on, or being turned on. Because these curves include the limitations of simultaneous high voltage and high current, up to the rating of the device, they are especially useful to designers of linear systems. The curves are based on a case temperature of 25°C and a maximum junction temperature of 175°C. Limitations for repetitive pulses at various case temperatures can be determined by using the thermal response curves. Motorola Application Note, AN569, "Transient Thermal Resistance—General Data and Its Use" provides detailed instructions.

SWITCHING SAFE OPERATING AREA

The switching safe operating area (SOA) of Figure 9 is the boundary that the load line may traverse without incurring damage to the MOSFET. The fundamental limits are the peak current, I_{DM} and the breakdown voltage, BV_{DSS} . The switching SOA shown in Figure 9 is applicable for both turn-on and turn-off of the devices for switching times less than one microsecond.

The power averaged over a complete switching cycle must be less than:

$$\frac{T_J(\max) - T_C}{R_{\theta JC}}$$

Figure 10. Thermal Response

COMMUTATING SAFE OPERATING AREA (CSOA)

The Commutating Safe Operating Area (CSOA) of Figure 12 defines the limits of safe operation for commutated source-drain current versus re-applied drain voltage when the source-drain diode has undergone forward bias. The curve shows the limitations of I_{FM} and peak V_{DS} for a given rate of change of source current. It is applicable when waveforms similar to those of Figure 11 are present. Full or half-bridge PWM DC motor controllers are common applications requiring CSOA data.

Device stresses increase with increasing rate of change of source current so di/dt is specified with a maximum value. Higher values of di/dt require an appropriate derating of I_{FM} , peak V_{DS} or both. Ultimately di/dt is limited primarily by device, package, and circuit impedances. Maximum device stress occurs during t_{rr} as the diode goes from conduction to reverse blocking.

$V_{DS(pk)}$ is the peak drain-to-source voltage that the device must sustain during commutation; I_{FM} is the maximum forward source-drain diode current just prior to the onset of commutation.

V_R is specified at rated $V_{(BR)DSS}$ to ensure that the CSOA stress is maximized as I_S decays from I_{RM} to zero.

R_{GS} should be minimized during commutation. T_J has only a second order effect on CSOA.

Stray inductances in Motorola's test circuit are assumed to be practical minimums. dV_{DS}/dt in excess of 10 V/ns was attained with di/dt of 400 A/ μ s.
