4.0 OPTICAL SPECIFICATION

4.1 Overview

The test of Optical specifications shall be measured in a dark room (ambient luminance 1 lux and temperature = $25 \pm 2^\circ\text{C}$) with the equipment of Luminance meter system (Goniometer system and TOPCONE PR730) and test unit shall be located at an approximate distance 50cm from the LCD surface at a viewing angle of θ and Φ equal to 0° . We refer to $\theta_{\theta=0} (= \theta_3)$ as the 3 o'clock direction (the "right"), $\theta_{\theta=90} (= \theta_{12})$ as the 12 o'clock direction ("upward"), $\theta_{\theta=180} (= \theta_9)$ as the 9 o'clock direction ("left") and $\theta_{\theta=270} (= \theta_6)$ as the 6 o'clock direction ("bottom"). While scanning θ and/or Φ , the center of the measuring spot on the Display surface shall stay fixed. The measurement shall be executed after 30 minutes warm-up period. VDD shall be $5.0\text{V} \pm 10\%$ at 25°C . Optimum viewing angle direction is 6 'clock.

4.2 Optical Specifications

[VDD = 5.0V , Frame rate = 60Hz, Clock = 75.4MHz, $I_{BL} = 340\text{mA}$, $T_a = 25 \pm 2^\circ\text{C}$]

Note :

1. The value in upper table are based on BLU provided by BOEDT.
2. Viewing angle is the angle at which the contrast ratio is greater than 10. The viewing are determined for the horizontal or 3, 9 o'clock direction and the vertical or 6, 12 o'clock direction with respect to the optical axis which is normal to the LCD surface.
3. Contrast measurements shall be made at viewing angle of $= 0^\circ$ and at the center of the LCD surface. Luminance shall be measured with all pixels in the view field set first to white, then to the dark (black) state. (See FIGURE 1 shown in Appendix) Luminance Contrast Ratio (CR) is defined mathematically.

$$CR = \frac{\text{Luminance when displaying a white raster}}{\text{Luminance when displaying a black raster}}$$

4. Luminance of LCD module shall be made without signal input. Cell transmittance is defined mathematically, BLU provided by BOEDT.

$$\text{Transmittance} = \frac{\text{Luminance of LCD Module}}{\text{Luminance of BLU}}$$

5. The White luminance uniformity on LCD surface is then expressed as :
 $\Delta Y = (\text{Minimum Luminance of 9points} / \text{Maximum Luminance of 9points}) * 100$
 (See FIGURE 2 shown in Appendix).
6. The color chromaticity coordinates specified in Table 4. shall be calculated from the spectral data measured with all pixels first in red, green, blue and white. Measurements shall be made at the center of the panel with BLU.
7. Response time T_g is the average time required for display transition by switching the input signal as below table and is based on Frame rate $f_V = 60\text{Hz}$ to optimize. Each time in below table is defined as appendix Figure 3 and shall be measured by switching the input signal for "any level of gray(bright)" and "any level of gray(dark)"
8. Cross-Talk of one area of the LCD surface by another shall be measured by comparing the luminance (Y_A) of a 25mm diameter area, with all display pixels set to a gray level, to the luminance (Y_B) of that same area when any adjacent area is driven dark. (See FIGURE 4 shown in Appendix).

9.0 POWER SEQUENCE

To prevent a latch-up or DC operation of the LCD module, the power on/off sequence shall be as shown in below

- $0.5 \text{ ms} \leq T1 \leq 10 \text{ ms}$
- $0 \leq T2 \leq 50 \text{ ms}$
- $0 \leq T3 \leq 50 \text{ ms}$
- $1 \text{ sec} \leq T4$
- $200 \text{ ms} \leq T5$
- $200 \text{ ms} \leq T6$

Notes:

1. When the power supply VDD is 0V, keep the level of input signals on the low or keep high impedance.
2. Do not keep the interface signal high impedance when power is on.
3. Back Light must be turn on after power for logic and interface signal are valid.
4. T7 decreases smoothly, there is none re-bouncing voltage.

<Table 6. Reliability Test Parameters >

No	Test Items	Conditions	
1	High temperature storage test	Ta = 60 °C, 240 hrs	Note 1
2	Low temperature storage test	Ta = -20 °C, 240 hrs	
3	High temperature & high humidity (operation test)	Ta = 50 °C, 80%RH, 240hrs	
4	High temperature operation test	Ta = 50 °C, 240hrs	
5	Low temperature operation test	Ta = -5 °C, 240hrs	
6	Thermal shock	Ta = -20 °C ↔ 60 °C (0.5 hr), 100 cycle	
7	Electro-static discharge test (non-operating)	Air: 150 pF, 330Ω, 15 KV Contact: 150 pF, 330Ω, 8 KV	
8	Packing Vibration Test	1.47Grms, 1~200Hz, Random X(30min), Y(30min), +Z (1hr)	Note 2
9	Drop Test	1Angle,3Edge,6Face Height: JIS-Z-0200 Level 1	

Notes:

1. The tests are done with LCD modules. (Use BOEDT&BJCT BLU)
2. The test is done with a package (20pcs open cell / 1 Box) shown in section 14.

12.0 HANDLING & CAUTIONS

(1) Cautions when taking out the open cell

- Pick the pouch only, when taking out open cell from a shipping package.

(2) Cautions for handling the open cell

- As the electrostatic discharges may break the LCD open cell, handle the LCD open cell with care. Peel a protection sheet off from the LCD panel surface as slowly as possible.
- As the LCD panel is made from fragile glass material, impulse and pressure to the LCD module should be avoided.
- As the surface of the polarizer is very soft and easily scratched, use a soft dry cloth without chemicals for cleaning.
- Do not pull the interface connector in or out while the LCD open cell is operating.
- Handle connectors and cables with care.

(3) Cautions for the operation

- When the open cell is operating, do not lose CLK, ENAB signals. If any one of these signals is lost, the LCD panel would be damaged.
- Obey the supply voltage sequence. If wrong sequence is applied, the open cell would be damaged.

(4) Cautions for the atmosphere

- Dew drop atmosphere should be avoided.
- Do not store and/or operate the LCD open cell in a high temperature and/or humidity atmosphere. Storage in an electro-conductive polymer packing pouch and under relatively low temperature atmosphere is recommended.

(5) Cautions for the open cell characteristics

- Do not apply fixed pattern data signal to the LCD open cell at product aging.
- Applying fixed pattern for a long time may cause image sticking.

(6) Other cautions

- Do not re-adjust variable resistor or switch etc.
- When returning the open cell for repair or etc., Please pack the open cell not to be broken. We recommend to use the original shipping packages.

Note (1) LED light bar input voltage and current are measured by utilizing a true RMS multimeter as shown below:

Note (2) PBL = IPIN × VPIN

Note (3) The lifetime of LED is defined as the time when LED packages continue to operate under the conditions at $T_a = 25 \pm 2 ^\circ C$ and $I = (25)mA$ (per chip) until the brightness becomes $\leq 50\%$ of its original value.
