

# MX27C1000/1001

## 1M-BIT [128K x 8] CMOS EPROM

### FEATURES

- 128K x 8 organization
- Single +5V power supply
- +12.5V programming voltage
- Fast access time: 45/55/70/90/100/120/150 ns
- Totally static operation
- Completely TTL compatible
- Operating current: 30mA
- Standby current: 100uA
- Package type:
  - 32 pin ceramic DIP, plastic DIP
  - 32 pin SOP
  - 32 pin PLCC
  - 32 pin TSOP

### GENERAL DESCRIPTION

The MX27C1000/1001 is a 5V only, 1M-bit, ultraviolet Erasable Programmable Read Only Memory. It is organized as 128K words by 8 bits per word, operates from a single + 5 volt supply, has a static standby mode, and features fast single address location programming. All programming signals are TTL levels, requiring a single pulse. For programming outside from the system, existing

EPROM programmers may be used. The MX27C1000/1001 supports an intelligent fast programming algorithm which can result in programming time of less than thirty seconds.

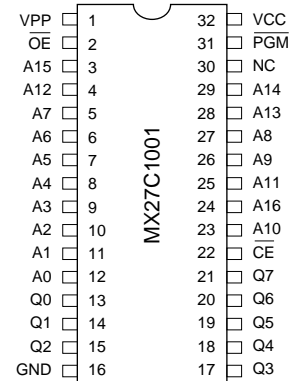

This EPROM is packaged in industry standard 32 pin dual-in-line packages, 32 lead PLCC, 32 lead SOP, and 32 lead TSOP packages.

### PIN CONFIGURATIONS

#### CDIP/PDIP/SOP

#### CDIP/PDIP/SOP(MX27C1001)

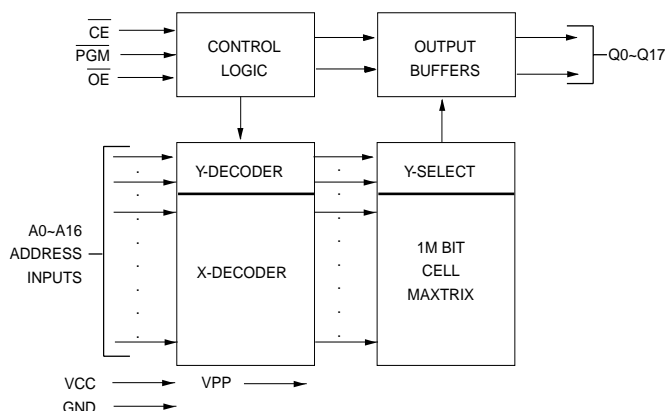

#### PLCC

#### TSOP(MX27C1000)

## BLOCK DIAGRAM

## PIN DESCRIPTION

SYMBOL	PIN NAME
A0~A16	Address Input
Q0~Q7	Data Input/Output
$\overline{\text{CE}}$	Chip Enable Input
$\overline{\text{OE}}$	Output Enable Input
$\overline{\text{PGM}}$	Programmable Enable Input
VPP	Program Supply Voltage
NC	No Internal Connection
VCC	Power Supply Pin (+5V)
GND	Ground Pin

## FUNCTIONAL DESCRIPTION

### THE ERASURE OF THE MX27C1000/1001

The MX27C1000/1001 is erased by exposing the chip to an ultraviolet light source. A dosage of 15 W seconds/cm<sup>2</sup> is required to completely erase a MX27C1000/1001. This dosage can be obtained by exposure to an ultraviolet lamp - wavelength of 2537 Angstroms (Å) - with intensity of 12,000 uW/cm<sup>2</sup> for 15 to 20 minutes. The MX27C1000/1001 should be directly under and about one inch from the source and all filters should be removed from the UV light source prior to erasure.

It is important to note that the MX27C1000/1001, and similar devices, will be cleared for all bits of their programmed states with light sources having wavelengths shorter than 4000 Å. Although erasure times will be much longer than that with UV sources at 2537 Å nevertheless the exposure to fluorescent light and sunlight will eventually erase the MX27C1000/1001 and exposure to them should be prevented to realize maximum system reliability. If used in such an environment, the package window should be covered by an opaque label or substance.

### THE PROGRAMMING OF THE MX27C1000/1001

When the MX27C1000/1001 is delivered, or it is erased, the chip has all 1M bits in the "ONE" or HIGH state. "ZEROS" are loaded into the MX27C1000 through the procedure of programming.

For programming, the data to be programmed is applied with 8 bits in parallel to the data pins.

Vcc must be applied simultaneously or before Vpp, and removed simultaneously or after Vpp. When programming an MXIC EPROM, a 01.µF capacitor is required across Vpp and ground to suppress spurious voltage transients which may damage the device.

### FAST PROGRAMMING

The device is set up in the fast programming mode when the programming voltage VPP = 12.75V is applied, with VCC = 6.25 V and PGM = VIL(or OE = VIH) (Algorithm is shown in Figure 1). The programming is achieved by applying a single TTL low level 100µs pulse to the PGM input after addresses and data line are stable. If the data is not verified, an additional pulse is applied for a maximum of 25 pulses. This process is repeated while sequencing through each address of the device. When the programming mode is completed, the data in all address is verified at VCC = VPP = 5V ± 10%.

### PROGRAM INHIBIT MODE

Programming of multiple MX27C1000/1001s in parallel with different data is also easily accomplished by using the Program Inhibit Mode. Except for CE and OE, all like inputs of the parallel MX27C1000/1001 may be common. A TTL low-level program pulse applied to an MX27C1000/1001 CE input with  $V_{PP} = 12.5 \pm 0.5$  V and PGM LOW will program that MX27C1000/1001. A high-level CE input inhibits the other MX27C1000/1001s from being programmed.

### PROGRAM VERIFY MODE

Verification should be performed on the programmed bits to determine that they were correctly programmed. The verification should be performed with OE and CE at VIL, PGM at VIH, and VPP at its programming voltage.

### AUTO IDENTIFY MODE

The auto identify mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and device type. This mode is intended for use by programming equipment for the purpose of automatically matching the device to be programmed with its corresponding programming algorithm. This mode is functional in the  $25^{\circ}\text{C} \pm 5^{\circ}\text{C}$  ambient temperature range that is required when programming the MX27C1000/1001.

To activate this mode, the programming equipment must force  $12.0 \pm 0.5$  V on address line A9 of the device. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from VIL to VIH. All other address lines must be held at VIL during auto identify mode.

Byte 0 (A0 = VIL) represents the manufacturer code, and byte 1 (A0 = VIH), the device identifier code. For the MX27C1000/1001, these two identifier bytes are given in the Mode Select Table. All identifiers for manufacturer and device codes will possess odd parity, with the MSB (DQ7) defined as the parity bit.

### READ MODE

The MX27C1000/1001 has two control functions, both of which must be logically satisfied in order to obtain data at the outputs. Chip Enable (CE) is the power control and should be used for device selection. Output Enable (OE) is the output control and should be used to gate

data to the output pins, independent of device selection. Assuming that addresses are stable, address access time ( $t_{ACC}$ ) is equal to the delay from CE to output ( $t_{CE}$ ). Data is available at the outputs  $t_{QE}$  after the falling edge of OE, assuming that CE has been LOW and addresses have been stable for at least  $t_{ACC} - t_{QE}$ .

### STANDBY MODE

The MX27C1000/1001 has a CMOS standby mode which reduces the maximum VCC current to 100  $\mu\text{A}$ . It is placed in CMOS standby when CE is at  $V_{CC} \pm 0.3$  V. The MX27C1000/1001 also has a TTL-standby mode which reduces the maximum VCC current to 1.5 mA. It is placed in TTL-standby when CE is at VIH. When in standby mode, the outputs are in a high-impedance state, independent of the OE input.

### TWO-LINE OUTPUT CONTROL FUNCTION

To accommodate multiple memory connections, a two-line control function is provided to allow for:

1. Low memory power dissipation,
2. Assurance that output bus contention will not occur.

It is recommended that CE be decoded and used as the primary device-selecting function, while OE be made a common connection to all devices in the array and connected to the READ line from the system control bus. This assures that all deselected memory devices are in their low-power standby mode and that the output pins are only active when data is desired from a particular memory device.

### SYSTEM CONSIDERATIONS

During the switch between active and standby conditions, transient current peaks are produced on the rising and falling edges of Chip Enable. The magnitude of these transient current peaks is dependent on the output capacitance loading of the device. At a minimum, a 0.1  $\mu\text{F}$  ceramic capacitor (high frequency, low inherent inductance) should be used on each device between VCC and GND to minimize transient effects. In addition, to overcome the voltage drop caused by the inductive effects of the printed circuit board traces on EPROM arrays, a 4.7  $\mu\text{F}$  bulk electrolytic capacitor should be used between VCC and GND for each eight devices. The location of the capacitor should be close to where the power supply is connected to the array.

## MODE SELECT TABLE

MODE	PINS						OUTPUTS
	$\overline{CE}$	$\overline{OE}$	$\overline{PGM}$	A0	A9	VPP	
Read	VIL	VIL	X	X	X	VCC	DOUT
Output Disable	VIL	VIH	X	X	X	VCC	High Z
Standby (TTL)	VIH	X	X	X	X	VCC	High Z
Standby (CMOS)	VCC±0.3V	X	X	X	X	VCC	High Z
Program	VIL	VIH	VIL	X	X	VPP	DIN
Program Verify	VIL	VIL	VIH	X	X	VPP	DOUT
Program Inhibit	VIH	X	X	X	X	VPP	High Z
Manufacturer Code(3)	VIL	VIL	X	VIL	VH	VCC	C2H
Device Code(27C1000)(3)	VIL	VIL	X	VIH	VH	VCC	0EH
Device Code(27C1001)(3)	VIL	VIL	X	VIH	VH	VCC	0FH

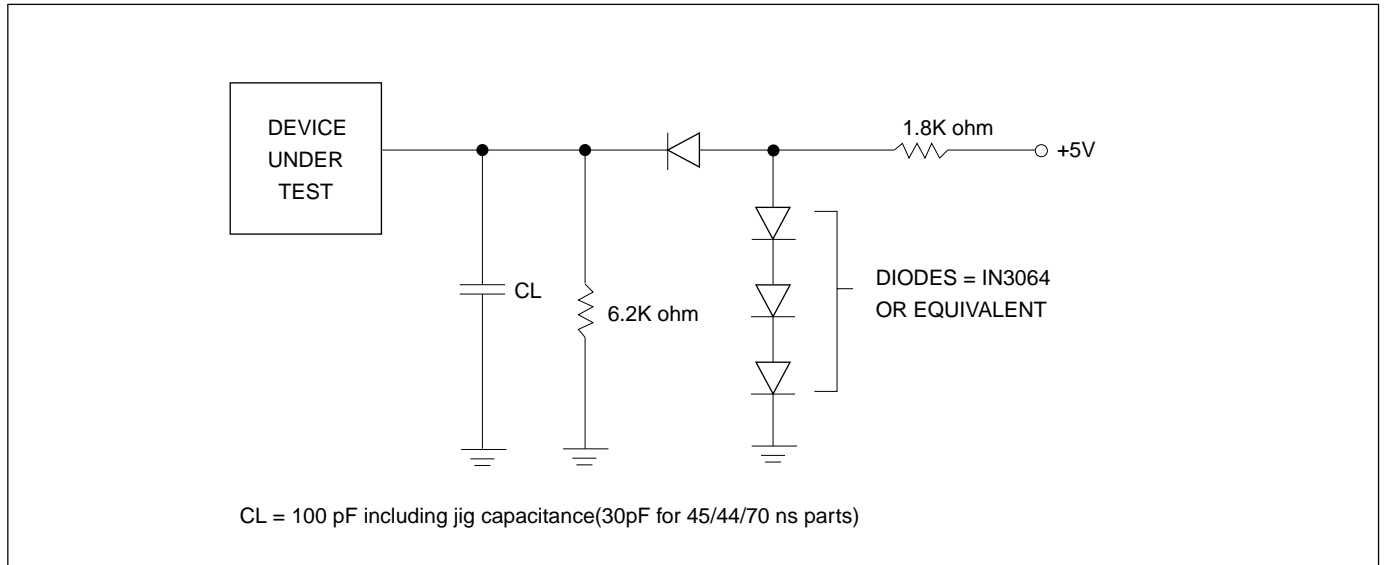

**NOTES:** 1. VH = 12.0 V ± 0.5 V  
2. X = Either VIH or VIL

3. A1 - A8 = A10 - A16 = VIL(For auto select)  
4. See DC Programming Characteristics for VPP voltage during programming.

## SWITCHING TEST CIRCUITS

## SWITCHING TEST WAVEFORMS

## ABSOLUTE MAXIMUM RATINGS

RATING	VALUE
Ambient Operating Temperature	-40°C to 85°C
Storage Temperature	-65°C to 125°C
Applied Input Voltage	-0.5V to 7.0V
Applied Output Voltage	-0.5V to VCC + 0.5V
VCC to Ground Potential	-0.5V to 7.0V
A9 & Vpp	-0.5V to 13.5V

### NOTICE:

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.

### NOTICE:

Specifications contained within the following tables are subject to change.

## DC/AC Operating Conditions for Read Operation

K	15.22 ± .25	.600 ± .010
L	13.97 ± .25	.550 ± .010
M	.25 [Typ.]	.010 [Typ.]

**NOTE:** Each lead centerline is located within .25 mm[.01 inch] of its true position [TP] at maximum material condition.

## PACKAGE INFORMATION(Continued)

### 32-PIN PLASTIC SOP (450 mil)

ITEM	MILLIMETERS	INCHES									
A	20.95 max.	.825 max.									
B	1.00 [REF]	.039 [REF]									
C	1.27 [TP]	.050 [TP]									
D	.40 [Typ.]	.016 [Typ.]									
E	.05 min.	.002 min.									
F	3.05 max.	.120 max.									
G	2.69 ± .13	.106 ± .005									
H	14.12 ± .25	.556 ± .010									
I	11.30 ± .13	.445 ± .005	J	1.42	.056	K	.20 [Typ.]	.008 [Typ.]	L	.79	.031
J	1.42	.056									
K	.20 [Typ.]	.008 [Typ.]									
L	.79	.031									

**NOTE:** Each lead centerline is located within .25 mm [.01 inch] of its true position [TP] at maximum material condition.

### 32-PIN PLASTIC LEADED CHIP CARRIER (PLCC)

ITEM	MILLIMETERS	INCHES
A	12.44 ± .13	.490 ± .005
B	11.50 ± .13	.453 ± .005
C	14.04 ± .13	.553 ± .005
D	14.98 ± .13	.590 ± .005
E	1.93	.076
F	3.30 ± .25	.130 ± .010
G	2.03 ± .13	.080 ± .005
H	.51 ± .13	.020 ± .005
I	1.27 [Typ.]	.050 [Typ.]
J	.71 [REF]	.028 [REF]
K	.46 [REF]	.018 [REF]
L	10.40/12.94 (W) (L)	.410/.510 (W) (L)
M	.89 R	.035 R
N	.25 (TYP.)	.010 (TYP.)

**NOTE:** Each lead centerline is located within .25 mm [.01 inch] of its true position [TP] at maximum material condition.

## PACKAGE INFORMATION

### 32-PIN PLASTIC TSOP

ITEM	MILLIMETERS	INCHES
A	20.0 ± .20	.788 ± .006
B	18.40 ± .10	.724 ± .004
C	8.20 max.	.323 max.
D	0.15 [Typ.]	.006 [Typ.]
E	.80 [Typ.]	.031 [Typ.]
F	.20 ± .10	.008 ± .004
G	.30 ± .10	.012 ± .004
H	.50 [Typ.]	.020 [Typ.]
I	.45 max.	.018 max.
J	0 ~ .20	0 ~ .008
K	1.00 ± .10	.039 ± .004
L	1.27 max.	.050 max.
M	.50	.020
N	19.00	.748
O	0 ~ 5	.500

**NOTE:** Each lead centerline is located within .25 mm [.01 inch] of its true position [TP] at a maximum material condition.

## Revision History

Revision No.	Description	Date
5.0	1) Reduce operating current change from 40mA to 30mA. 2) Eliminate Interactive Programming Mode. 3) Add 27C1001 pin configuration.	5/28/1997
5.1	IPP 100uA --> 10uA	8/08/1997
5.2	Change TSOP Orientation	4/09/1998
5.3	27C1000CDIP 70/90/100/120/150ns speed grades deleted from ordering information.	5/07/1998
