SP6T Switch with MIPI for LTE Diversity

This document contains information that is confidential and proprietary to Maxscend Microelectronics Company Limited (Maxscend) and may not be reproduced in any form without express written consent of Maxscend. No transfer or licensing of technology is implied by this document.

General Description

The MXD8668 is a low loss, high isolation SP6T switch for antenna diversity receiving.

The MXD8668 is compatible with MIPI control, which is a key requirement for many cellular transceivers. This part is packaged in a compact 2mm x 2mm, 14-pin, QFN package which allows for a small solution size with no need for external DC blocking capacitors (when no external DC is applied to the device ports).

Features

- Excellent insertion loss
 - 0.50 dB Insertion Loss at 2.7GHz
- P0.1dB @ 27dBm
- Multi-Band operation 700MHz to 3000MHz
- RFFE serial control interface
- Compact 2mm x 2mm in QFN-14 package
- No DC blocking capacitors required (unless external DC is applied to the RF ports)

Applications

- 2G/3G/4G antenna diversity
- Cellular modems and USB Devices

MIPI Read and Write Timing

MIPI supports the following Command Sequences:

- Register Write
- Register_0 Write
- Register Read

Figures 3 and 4 provide the timing diagrams for register write commands and read commands, respectively. Figure 5 shows the Register 0 Write Command Sequence. Refer to the MIPI Alliance Specification for RF Front-End Control Interface (RFFE), v1.10 (26 July 2011) for additional information on MIPI USID programming sequences and MIPI bus specifications.

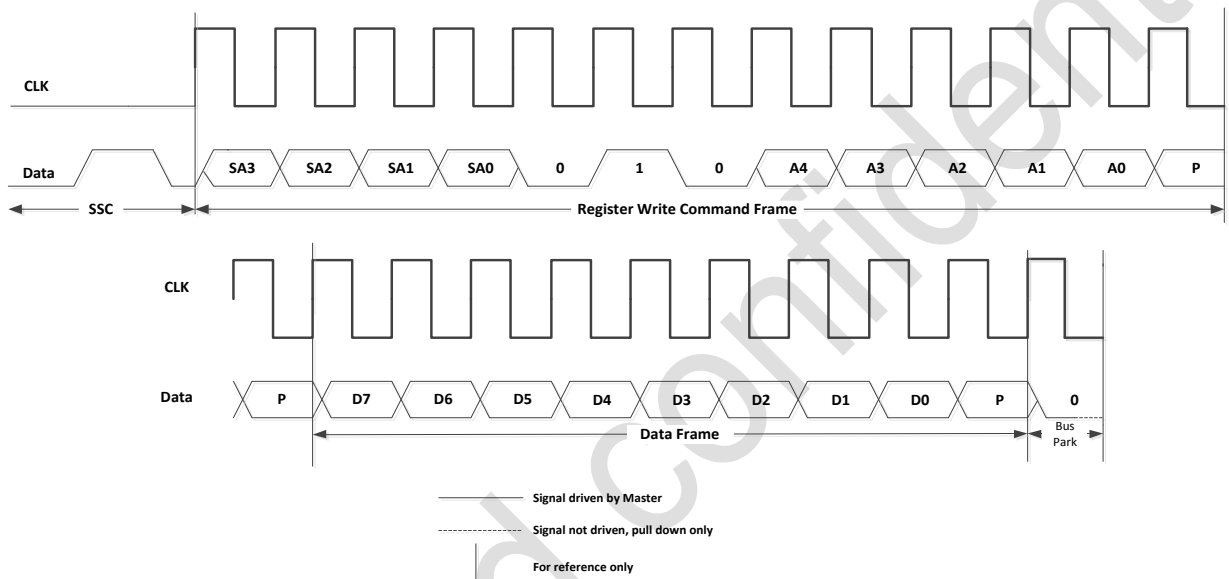

Figure 3. Register Write Command Sequence

Figure 4. Register Read Command Sequence

In the timing figures, SA[3:0] is slave address. A[4:0] is register address. D[7:0] is data. “P” is odd parity bit.

Register 0 Write Command Sequence

Figure shows the Register 0 Write Command Sequence. The Command Sequence starts with an SSC, followed by the Register 0 Write Command Frame containing the Slave address, a logic one, and a seven bit word to be written to Register 0. The Command Sequence ends with a Bus Park Cycle.

Charged device model (CDM), Class III	ESD_CDM		500	

Note: Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal value. Exceeding any of the limits listed here may result in permanent damage to the device

Power ON and OFF sequence

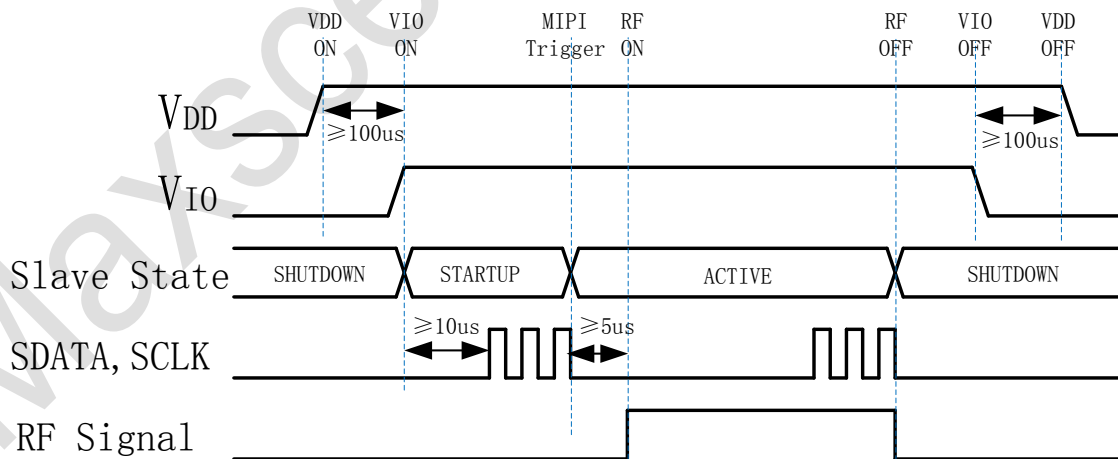

Here is the recommendation about power-on/off sequence in order to avoid damaging the device.

Power ON

- 1) Apply voltage supply - V_{DD}
- 2) Apply logic supply - V_{IO}
- 3) Wait 10µs or greater and then apply MIPI bus signals – SCLK and SDATA
- 4) Wait 5µs or greater after MIPI bus goes idle and then apply the RF Signal

Power OFF

- 1) Remove the RF Signal
- 2) Remove MIPI bus – SCLK and SDATA
- 3) Remove logic supply - V_{IO}
- 4) Remove voltage supply - V_{DD}

Note: V_{IO} can be applied to the device before V_{DD} or removed after V_{DD}.

It is important to wait 10µs after V_{IO} & V_{DD} are applied before sending SDATA to ensure correction data transmission.

The minimum time between a power up and power down sequence (and vice versa) is ≥ 100µs.

Profile Parameter	Lead-Free Assembly, Convection, IR/Convection
Ramp-up rate (TS_{max} to T_p)	3°C/second max.
Preheat temperature (TS_{min} to TS_{max})	150°C to 200°C
Preheat time (t_s)	60 - 180 seconds
Time above T_L , 217°C (t_L)	60 - 150 seconds
Peak temperature (T_p)	260°C
Time within 5°C of peak temperature(t_p)	20 - 40 seconds
Ramp-down rate	6°C/second max.
Time 25°C to peak temperature	8 minutes max.

ESD Sensitivity

Integrated circuits are ESD sensitive and can be damaged by static electric charge. Proper ESD protection techniques should be used when handling these devices.

RoHS Compliant

This product does not contain lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) and polybrominated diphenyl ethers (PBDE), and are considered RoHS compliant.
