I_{IS}: the maximum current of the first 100ms after power-on

Measurement Conditions: Shown as the following figure. Test pattern: black.

VCCS rising time is 0.5ms

Note (3) The specified power supply current is under the conditions at $V_{CCS} = 3.3 \text{ V}$, $T_a = 25 \pm 2 \text{ }^{\circ}\text{C}$, DC Current and $f_v = 60 \text{ Hz}$, whereas a specified power dissipation check pattern is displayed.

Note (1) I_{LED_RUSH}: the maximum current when LED_VCCS is rising,

I_{LED_IS}: the maximum current of the first 100ms after power-on,

Measurement Conditions: Shown as the following figure. LED_VCCS = Typ, Ta = 25 ± 2 °C, f_{PWM} = 200 Hz, Duty=100%.

Note (2) If the PWM control duty ratio is less than 10%, there is some possibility that acoustic noise or backlight flash can be found. And it is also difficult to control the brightness linearity.

Note (3) If PWM control frequency is applied in the range less than 1KHz, the “waterfall” phenomenon on the screen may be found. To avoid the issue, it’s a suggestion that PWM control frequency should follow the criterion as below.

PWM control frequency f_{PWM} should be in the range

$$(N + 0.33) * f \leq f_{PWM} \leq (N + 0.66) * f$$

N : Integer ($N \geq 3$)

f : Frame rate

Note (4) The specified LED power supply current is under the conditions at “LED_VCCS = Typ.”, $T_a = 25 \pm 2^\circ\text{C}$, $f_{PWM} = 200\text{ Hz}$, Duty=100%.

LED Life Time	L _{BL}	15000	-	-	Hrs	(4)

Note (1) LED current is measured by utilizing a high frequency current meter as shown below :

Note (2) For better LED light bar driving quality, it is recommended to utilize the adaptive boost converter with current balancing function to drive LED light-bar.

Note (3) $P_L = I_L \times V_L$ (Without LED converter transfer efficiency)

Note (4) The lifetime of LED is defined as the time when it continues to operate under the conditions at Ta = 25 ± 2 °C and I_L = 20 mA (Per EA) until the brightness becomes ≤ 50% of its original value.

Note (1) Definition of Viewing Angle (θ_x, θ_y):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

$$\text{Contrast Ratio (CR)} = L_{63} / L_0$$

L63: Luminance of gray level 63

L 0: Luminance of gray level 0

$$CR = CR (1)$$

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

L (x) is corresponding to the luminance of the point X at Figure in Note (6)

Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

Note (6) Definition of White Variation (δW):

Measure the luminance of White at 5 points

$$\delta W_{5p} = \{ \text{Minimum } [L(1) \sim L(5)] / \text{Maximum } [L(1) \sim L(5)] \} * 100\%$$

Note (7) The listed optical specifications refer to the initial value of manufacture, but the condition of the specifications after long-term operation will not be warranted.

8. PRECAUTIONS

8.1 HANDLING PRECAUTIONS

- (1) The module should be assembled into the system firmly by using every mounting hole. Be careful not to twist or bend the module.
- (2) While assembling or installing modules, it can only be in the clean area. The dust and oil may cause electrical short or damage the polarizer.
- (3) Use fingerstalls or soft gloves in order to keep display clean during the incoming inspection and assembly process.
- (4) Do not press or scratch the surface harder than a HB pencil lead on the panel because the polarizer is very soft and easily scratched.
- (5) If the surface of the polarizer is dirty, please clean it by some absorbent cotton or soft cloth. Do not use Ketone type materials (ex. Acetone), Ethyl alcohol, Toluene, Ethyl acid or Methyl chloride. It might permanently damage the polarizer due to chemical reaction.
- (6) Wipe off water droplets or oil immediately. Staining and discoloration may occur if they left on panel for a long time.
- (7) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contacting with hands, legs or clothes, it must be washed away thoroughly with soap.
- (8) Protect the module from static electricity, it may cause damage to the C-MOS Gate Array IC.
- (9) Do not disassemble the module.
- (10) Do not pull or fold the LED wire.
- (11) Pins of I/F connector should not be touched directly with bare hands.

8.2 STORAGE PRECAUTIONS

- (1) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (2) It is dangerous that moisture come into or contacted the LCD module, because the moisture may damage LCD module when it is operating.
- (3) It may reduce the display quality if the ambient temperature is lower than 10 °C. For example, the response time will become slowly, and the starting voltage of LED will be higher than the room temperature.

8.3 OPERATION PRECAUTIONS

- (1) Do not pull the I/F connector in or out while the module is operating.
- (2) Always follow the correct power on/off sequence when LCD module is connecting and operating. This can prevent the CMIS LSI chips from damage during latch-up.
- (3) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with converter. Do not disassemble the module or insert anything into the Backlight unit.

Appendix. EDID DATA STRUCTURE

Appendix. OUTLINE DRAWING

- NOTES:
1. LCD MODULE INPUT CONNECTOR : I-PEX 20455-040E-12
 2. IN ORDER TO AVOID ABNORMAL DISPLAY, POOLING AND WHITE SPOT, NO OVERLAPPING IS SUGGESTED AT CABLES, ANTENNAS, CAMERA, WLAN, WAN OR FOREIGN OBJECTS OVER COF, T-CON AND VR LOCATIONS.
 3. LVDS CONNECTOR IS MEASURED AT PIN1 AND ITS MATING LINE.
 4. MODULE FLATNESS SPEC 0.5mm MAX.
 5. 'X' MARKS THE REFERENCE DIMENSIONS.

Appendix. SYSTEM COVER DESIGN NOTICE

1.	Design gap A between panel & any components on system cover
	 <p>Max. Thickness</p> <p>Panel Module</p> <p>System cover inner surface</p> <p>Components, foreign objects, wire, cable or extrusion on system cover inner surface.</p> <p>A</p>
Definition	<p>a). Sufficient gap between panel & system is a must for preventing from backpack or pogo test fail.</p> <p>b). Zero gap from panel's maximum thickness boundary to any components, foreign objects, wire, cable or extrusion on system cover inner surface is forbidden.</p>
2	Design gap B1 & B2 between panel & protrusions
	 <p>B1</p> <p>Protrusion</p> <p>Protrusion</p> <p>B2</p>
Definition	<p>2.0mm min. gap is recommended between panel & protrusions for preventing from shock related failures.</p>
3	Design gap C between system front bezel & panel surface.

	
Definition	<p>a). Sufficient gap between system front bezel & panel surface is a must for preventing from pooling or glass broken.</p> <p>b). Zero gap or interference is forbidden.</p>
4	Design gap D1 & D2 between system front bezel & PCB Assembly.
	
Definition	<p>a). Sufficient gap between system front bezel & PCB assembly is a must for preventing from abnormal display after backpack test, hinge test, twist test or pogo test.</p> <p>b). Zero gap or interference is forbidden.</p>
5	Interference examination of antenna cable and WebCam wire
	
Definition	<p>a). Antenna cable or WebCam wire overlap with panel outline is forbidden for preventing from abnormal display & white spot after backpack test, hinge test, twist test or pogo test.</p> <p>b). Antenna cable or WebCam wire bypass panel outline is recommended.</p>
6	System inner surface examination

	
Definition	<p>a). Burr at logo edge, step, protrusion or PCB board will easily cause white spot or glass broken.</p> <p>b). Keeping flat surface underneath backlight is recommended.</p>
7	Tape/sponge design on system inner surface
	
Definition	<p>a) To prevent abnormal display & white spot after scuffing test, hinge test, pogo test, backpack test, it is not recommended to add tape/sponge in separate location. Since each tape/sponge may act as pressure concentration location.</p> <p>b) We suggest to design a tape/sponge that well covered under panel rear cover.</p>
8	Assembly SOP examination
	
Definition	To prevent panel crack during system front bezel assembly process with hook design, it is prohibited to press panel or any location that related directly to the panel.

9	Material used for system rear bezel
	
Definition	To prevent panel crack during system front bezel assembly process without hook design, it is only allowed to give slight pressure with large contact area. This can help to distribute the stress to prevent point concentration, also it is suggest to put the system on a flat surface stage during the assembly.
10	Material used for system rear bezel
	
Definition	<p>a) To prevent abnormal display & white spot after scuffing test, hinge test, pogo test, backpack test, as the poor rigidity result from deformation of system rear cover during the test.</p> <p>b) We suggest to use aluminum-magnesium alloy as the rear frame material with thickness min 1.5mm, instead of using PC/ABS.</p>
11	System base unit design near keyboard and mouse pad
	
Definition	To prevent abnormal display & white spot after scuffing test, hinge test, pogo test, backpack test, no sharp edge design is allowed in any area that may damage the panel during the test. We suggest to remove all sharp edges, or to reduce the thickness difference of keyboard/mouse pad from the nearby surface.
