

# Agilent N8201A Performance Downconverter Synthetic Instrument Module 3 Hz to 26.5 GHz

Data Sheet

The Agilent Technologies N8201A performance downconverter synthetic instrument module down converts a microwave signal to an IF signal providing IF output frequencies of 7.5, 21.4, and 321.4 MHz to offer three different signal bandwidth capabilities. External mixing can be utilized to downconvert microwave signals up to 110 GHz. The N8201A is based upon the industry's most accurate spectrum analyzer, the PSA Series spectrum analyzer.

Agilent's synthetic instrument family offers the highest-performing RF/MW LAN-based modular instrumentation and the smallest footprint for automated test systems (ATSs); providing the maximum flexibility and minimizing the cost of an ATS over its lifetime.

- LXI Class-A compliant
- Microwave performance similar to the E4440A PSA Series high-performance spectrum analyzer
- Coherent LO input/output port allowing a common LO signal to drive multiple downconverters
- · 200 MHz wide modulation bandwidth with pre-selector off

#### **Definitions and Conditions**

**Specifications (spec):** Specifications describe the performance of parameters covered by the product warranty and apply over 0 to 55 °C temperature range unless otherwise noted.

Typical (typ): Typical describes additional product performance information that is not covered by the product warranty. It is performance beyond specifications that 80 percent of the units exhibit with a 95 percent confidence level over the temperature range of 20 to 30 °C. Typical performance does not include measurement uncertainty.

Nominal (nom): Nominal values indicate expected performance, or describe product performance that is useful in the application of the product, but is not covered by the product warranty. Nominal values represent the value of a parameter that is most likely to occur; they represent the expected mean or average.

The N8201A performance downconverter will meet its specifications when:

- Stored a minimum of two hours within the operating temperature range and turned on for at least 30 minutes with Auto Align On selected.
- The instrument is within its one-year calibration cycle.
- Align All Now has been performed within the past 24 hours or when the temperature changes 3 °C.
- Front panel 1st LO OUT connector terminated in 50  $\Omega$ .
- DC coupling applied if RF frequency is < 20 MHz.</li>
- Front panel 1st and 2nd LO jumpers must be installed.

- 1. Calibration accuracy depends on how accurately the frequency standard was adjusted to 10 MHz. If the calibration procedure is followed, the calibration accuracy is given by the specification "Achievable initial calibration accuracy."
- 2. For periods of one year or more.
- 3. Applies only when power is disconnected from instrument. Does not apply when instrument is in standby mode.
- www.Dat4.SThe achievable calibration accuracy at the beginning of the calibration cycle includes these effects:
  - a) The temperature difference between the calibration environment and the use environment
  - b) The orientation relative to the gravitation field changing between the calibration environment and the use environment
  - c) Retrace effects in both the calibration environment and the use environment due to unplugging the instrument
  - d) Settability
  - 5. The IF bandwidth is 60 MHz if used at a center frequency of 321.4 MHz.
  - 6. See figure above for nominal 4 dB IF bandwidth of preselector.

Figure 3. Nominal phase noise at diffferent LO center frequencies

Nominal changes of phase noise sidebands with other center frequencies are shown by some examples in the graphs that follow. To predict the phase noise for
other center frequencies, note that phase noise at offsets above approximately 1 kHz increases nominally as 20 x log N, where N is the harmonic mixer mode.
 For offsets below 1 kHz, and center frequencies above 1 GHz, the phase noise increases nominally as 20 log CF, where CF is the center frequency in GHz.

<sup>2.</sup> Noise sidebands for offsets of 30 kHz and below are shown for phase noise optimization set to optimize £(f) for f < 50 kHz; for offsets of 100 kHz and above, the optimization is set for f > 50 kHz.

<sup>1.</sup> Gain compression is described by a level/compression pair where for every mixer level there is a different amount of compression. The first table labeled "1 dB compression point" indicates the signal level where you will see 1 dB of compression, where as the second table indicates the amount of compression www.DataSto.expect at a given signal level.

<sup>2.</sup> Large signals, even at frequencies not within the IF bandwidth, can cause in-band signals to be compressed because of two-tone gain compression.

This specification tells how large an interfering signal must be in order to cause a 1 dB change in an in-band signal.

<sup>3.</sup> Mixer power level (dBm) = input power (dBm) – input attenuation (dB).

<sup>4.</sup> Input referred noise density (dBm/Hz) = thermal noise at +55 °C (dBm) + noise figure of the downconverter (dB). The noise measured at the IF output's of the downconverter will be higher due to the Conversion gain, the measurable noise density is not diminished due to this gain.

<sup>1.</sup> TOI = third order intercept. TOI = mixer tone level (dBm) - distortion (dBc) / 2, where distortion is the relative level of the distortion tones.

<sup>2.</sup> Mixer level (dBm) = input power (dBm) – input attenuation (dB).

<sup>3.</sup> Input referred level (dBm) = residual level at IF output (dBm) – conversion gain of downconverter (dB). This is the signal level which would be required at the input of the downconverter to create a signal at the IF output equal to the residual level.

#### **Regulatory Compliance**

#### **EMC**

Complies with European EMC Directive 89/336/EEC, amended by 93/68/EEC

- IEC/EN 61326
- CISPR Pub 11 Group 1, Class A
- AS/NZS CISPR 11:2002
- ICES/NMB-001

#### Safety

Complies with European low voltage directive 73/23/EEC, amended by 93/68/EEC

- IEC/EN 61010-1
- Canada: CSA C22.2 No. 61010-1
- USA: UL 61010-1

<sup>1.</sup> Hardware settling time is the time required for the IVI-COM driver command to return.

<sup>2.</sup> This is the frequency range containing both the initial and final RF input tuning frequencies. Example, if the previous RF input frequency is 1 GHz and the final frequency is 3 GHz, then the nominal settling time will be 175 ms.

#### **Environmental**

Samples of this product have been type tested in accordance with the Agilent Environmental Test Manual and verified to be robust against the environmental stresses of storage, transportation and end-use; those stresses include, but are not limited to temperature, humidity, shock, vibration, altitude, and power line conditions. Test methods are aligned with IEC 60068-2 and levels are similar to MIL-PRF-28800F Class 3.

Operating temperature range	0 to 55 °C
Storage temperature range	-40 to 70 °C

**Humidity** Type tested: 0 to 95% at 40 °C

Altitude Type tested: 0m to 4600 m above mean sea level (15,000 ft) Acoustic emissions Type tested:  $L_{NPF} < 55 \text{ dB(A)}$  at 25 °C tested according to ISO 7779

#### **Shock and vibration**

Operating random	Type tested: 5 to 500 Hz, 0.21 g <sub>rms</sub> , close in phase noise may be significantly degraded due
	to microphonics.
Survival random vibration	Type tested: 5 to 500 Hz, 2.09 g <sub>rms</sub>
Survival swept sine vibration	Type tested: 5 to 500 Hz, 0.5 g <sub>peak</sub>
Transportation shock	Type tested: 50 G peak trapezoidal: 337 in/sec ΔV

#### **Data storage**

Height	17.7 cm (7.0 in)
Width	21.2 cm (8.375 in)
Length	65.0 cm (25.6 in)

#### **Recommended calibration cycle**

The recommended calibration cycle is 12 months. Calibration services are available through Agilent service centers.

#### Security

All user data is stored in volatile memory. For additional information on instrument security issues, visit: www.agilent.com/find/security

#### **ISO** compliance

This modular instrument is manufactured in an ISO-9001 registered facility in concurrence with Agilent Technologies, Inc. commitment to quality.

#### Warranty

This Agilent Technologies product is warranted against defects in materials and workmanship for a period of one year from date of shipment. During the warranty period, Agilent Technologies will, at its option, either repair or replace products that are defective.
