82S130 82S131

2K-bit TTL bipolar PROM

DESCRIPTION

The 82S130 and 82S131 are field programmable, which means that custom patterns are immediately available by following the Signetics Generic I fusing procedure. The 82S130 and 82S131 devices are supplied with all outputs at logical Low. Outputs are programmed to a logic High level at any specified address by fusing the Ni-Cr link matrix.

These devices include on-chip decoding and 1 Chip Enable input for ease of memory expansion. They feature either Open Collector or 3-State outputs for optimization of word expansion in bused organizations.

Ordering information can be found on the following page.

The 82S130 and 82S131 devices are also processed to military requirements for operation over the military temperature range. For specifications and ordering information, consult the Signetics Military Data Handbook.

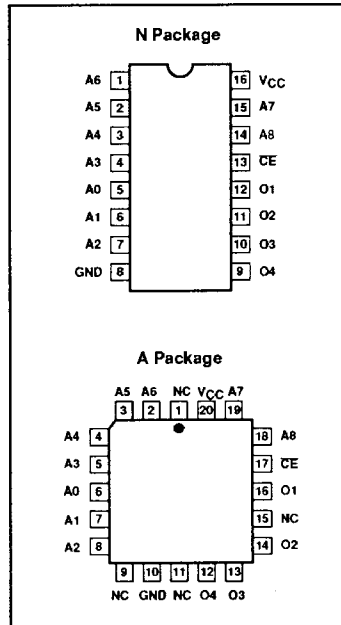

FEATURES

- Address access time: 50ns max
- Power dissipation: 0.3mW/bit typ
- Input loading: $-100\mu\text{A}$ max
- On-chip address decoding
- One Chip Enable input
- Output options:
 - N82S130: Open Collector
 - N82S131: 3-State
- No separate fusing pins
- Unprogrammed outputs are Low level
- Fully TTL compatible

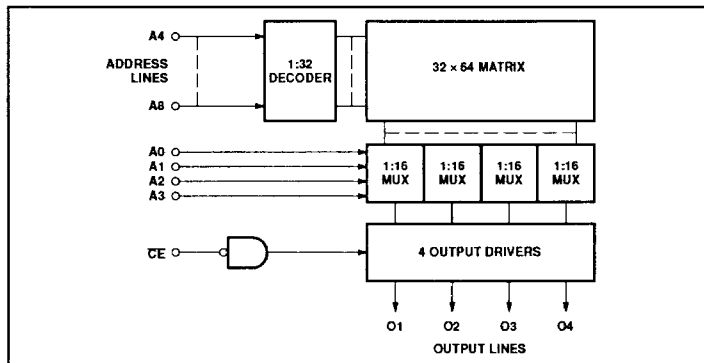

APPLICATIONS

- Prototyping/volume production
- Sequential controllers
- Microprogramming
- Hardwired algorithms
- Control store
- Random logic
- Code conversion

NOTES:

- Positive current is defined as into the terminal referenced.
- All voltages with respect to network ground.
- Typical values are at V_{CC} = 5V, T_{amb} = +25°C.
- Duration of short circuit should not exceed 1 second.
- Measured with all inputs grounded and all outputs open.
