

NB100LVEP222

2.5 V/3.3 V 1:15 Differential ECL/PECL ÷1/÷2 Clock Driver

The NB100LVEP222 is a low skew 1:15 differential $\div 1/\div 2$ ECL fanout buffer designed with clock distribution in mind. The LVECL/LVPECL input signal pairs can be used in a differential configuration or single-ended (with V_{BB} output reference bypassed and connected to the unused input of a pair). Either of two fully differential clock inputs may be selected. Each of the four output banks of 2, 3, 4, and 6 differential pairs may be independently configured to fanout 1X or 1/2X of the input frequency. When the output banks are configured with the $\div 1$ mode, data can also be distributed. The LVEP222 specifically guarantees low output to output skew. Optimal design, layout, and processing minimize skew within a device and from lot to lot. This device is an improved version of the MC100LVE222 with higher speed capability and reduced skew.

The f_{sel} pins and CLK_Sel pin are asynchronous control inputs. Any changes may cause indeterminate output states requiring an MR pulse to resynchronize any 1/2X outputs (See Figure 3). Unused output pairs should be left unterminated (open) to reduce power and switching noise.

The NB100LVEP222, as with most ECL devices, can be operated from a positive V_{CC}/V_{CC0} supply in LVPECL mode. This allows the LVEP222 to be used for high performance clock distribution in +2.5/3.3 V systems. In a PECL environment series or Thevenin line, terminations are typically used as they require no additional power supplies. For more information on using PECL, designers should refer to Application Note AN1406/D. For a SPICE model, refer to Application Note AN1560/D.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended LVPECL input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC}/V_{CC0} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open. Single-ended CLK input operation is limited to a $V_{CC}/V_{CC0} \geq 3.0$ V in LVPECL mode, or $V_{EE} \leq -3.0$ V in NECL mode.

- 20 ps Output-to-Output Skew
- 85 ps Part-to-Part Skew
- Selectable 1x or 1/2x Frequency Outputs
- LVPECL Mode Operating Range:
 $V_{CC}/V_{CC0} = 2.375$ V to 3.8 V with $V_{EE} = 0$ V
- NECL Mode Operating Range:
 $V_{CC}/V_{CC0} = 0$ V with $V_{EE} = -2.375$ V to -3.8 V
- Internal Input Pulldown Resistors
- Performance Upgrade to ON Semiconductor's MC100LVE222
- V_{BB} Output
- Pb-Free Packages are Available*

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

NB100LVEP222

All V_{CC} , V_{CC0} , and V_{EE} pins must be externally connected to appropriate Power Supply to guarantee proper operation. V_{CC} pin internally connected to V_{CC0} pins. The thermally conductive exposed pad on package bottom (see package case drawing) must be attached to a heat-sinking conduit. This exposed pad is electrically connected to V_{EE} internally.

Figure 1. 52-Lead LQFP Pinout (Top View)

PIN DESCRIPTION

PIN	FUNCTION
CLK0*, $\overline{CLK0}$ **	ECL Differential Input Clock
CLK1*, $\overline{CLK1}$ **	ECL Differential Input Clock
CLK_Sel*	ECL Clock Select
MR*	ECL Master Reset
Qa0:1, $\overline{Qa0}$:1	ECL Differential Outputs
Qb0:2, $\overline{Qb0}$:2	ECL Differential Outputs
Qc0:3, $\overline{Qc0}$:3	ECL Differential Outputs
Qd0:5, $\overline{Qd0}$:5	ECL Differential Outputs
fseln*	ECL $\div 1$ or $\div 2$ Select
V_{BB}	Reference Voltage Output
V_{CC} , V_{CC0}	Positive Supply, $V_{CC} = V_{CC0}$
V_{EE} ***	Negative Supply
NC	No Connect

* Pins will default LOW when left open.

** Pins will default HIGH when left open.

*** The thermally conductive exposed pad on the bottom of the package is electrically connected to V_{EE} internally.

NOTE: 100LVEP circuits are designed to meet the DC specifications shown in the above table, after thermal equilibrium has been established.

The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 lpm is maintained.

3. Input and output parameters vary 1:1 with V_{CC}/V_{CC0} . V_{EE} can vary + 0.125 V to -1.3 V.

4. All loading with 50 Ω to $V_{CC}/V_{CC0} - 2.0\text{ V}$.

5. Do not use V_{BB} Pin #10 at $V_{CC}/V_{CC0} < 3.0\text{ V}$ (see AND8066).

6. V_{IHCMR} min varies 1:1 with V_{EE} , V_{IHCMR} max varies 1:1 with V_{CC}/V_{CC0} . The V_{IHCMR} range is referenced to the most positive side of the differential input signal.

NB100LVEP222

LVPECL DC CHARACTERISTICS $V_{CC} = V_{CC0} = 3.3\text{ V}$; $V_{EE} = 0.0\text{ V}$ (Note 7)

APPLICATIONS INFORMATION

Using the thermally enhanced package of the NB100LVPE222

The NB100LVPE222 uses a thermally enhanced 52-lead LQFP package. The package is molded so that a portion of the leadframe is exposed at the surface of the package bottom side. This exposed metal pad will provide the low thermal impedance that supports the power consumption of the NB100LVPE222 high-speed bipolar integrated circuit and will ease the power management task for the system design. In multilayer board designs, a thermal land pattern on the printed circuit board and thermal vias are recommended to maximize both the removal of heat from the package and electrical performance of the NB100LVPE222. The size of the land pattern can be larger, smaller, or even take on a different shape than the exposed pad on the package. However, the solderable area should be at least the same size and shape as the exposed pad on the package. Direct soldering of the exposed pad to the thermal land will provide an efficient thermal conduit. The thermal vias will connect the exposed pad of the package to internal copper planes of the board. The number of vias, spacing, via diameters and land pattern design depend on the application and the amount of heat to be removed from the package.

Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern.

The recommended thermal land design for NB100LVPE222 applications on multi-layer boards comprises a 4 X 4 thermal via array using a 1.2 mm pitch as shown in Figure 7 providing an efficient heat removal path.

Figure 7. Recommended Thermal Land Pattern

The via diameter should be approximately 0.3 mm with 1 oz. copper via barrel plating. Solder wicking inside the via may result in voiding during the solder process and must be avoided. If the copper plating does not plug the vias, stencil print solder paste onto the printed circuit pad. This will

supply enough solder paste to fill those vias and not starve the solder joints. The attachment process for the exposed pad package is equivalent to standard surface mount packages. Figure 8, "Recommended solder mask openings", shows a recommended solder mask opening with respect to a 4 X 4 thermal via array. Because a large solder mask opening may result in a poor rework release, the opening should be subdivided as shown in Figure 8. For the nominal package standoff of 0.1 mm, a stencil thickness of 5 to 8 mils should be considered.

Figure 8. Recommended Solder Mask Openings

Proper thermal management is critical for reliable system operation. This is especially true for high-fanout and high output drive capability products.

For thermal system analysis and junction temperature calculation the thermal resistance parameters of the package is provided:

Table 1. Thermal Resistance *

LFPM	θ_{JA} °C/W	θ_{JC} °C/W
0	35.6	3.2
100	32.8	4.9
500	30.0	6.4

* Junction to ambient and Junction to board, four-conductor layer test board (2S2P) per JESD 51-8

These recommendations are to be used as a guideline, only. It is therefore recommended that users employ sufficient thermal modeling analysis to assist in applying the general recommendations to their particular application to assure adequate thermal performance. The exposed pad of the NB100LVPE222 package is electrically shorted to the substrate of the integrated circuit and V_{EE} . The thermal land should be electrically connected to V_{EE} .

NB100LVEP222

PACKAGE DIMENSIONS

LQFP 52 LEAD EXPOSED PAD PACKAGE CASE 848H-01 ISSUE A

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MM.
3. DATUM PLANE "E" IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING PLANE.
4. DATUM "X", "Y" AND "Z" TO BE DETERMINED AT DATUM PLANE DATUM "E".
5. DIMENSIONS M AND L TO BE DETERMINED AT SEATING PLANE DATUM "T".
6. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 (0.010) PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE "E".
7. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM D DIMENSION BY MORE THAN 0.08 (0.003). DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD OR PROTRUSION 0.07 (0.003).
