## 2.5V/3.3V Differential 2:1 MUX to 4 LVPECL Fanout Buffer

### Description

The NB3L8533 is a low skew 1:4 LVPECL Clock fanout buffer designed explicitly for low output skew applications.

The NB3L8533 features a multiplexed input which can be driven by either a differential or single-ended input to allow for the distribution of a lower speed clock along with the high speed system clock.

The CLK\_SEL pin will select the differential clock inputs, CLK and  $\overline{\text{CLK}}$ , when LOW (or left open and pulled LOW by the internal pull-down resistor). When CLK\_SEL is HIGH, the Differential PCLK and  $\overline{\text{PCLK}}$  inputs are selected.

The common enable (CLK\_EN) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip flop is clocked on the falling edge of the input clock, therefore, all associated specification limits are referenced to the negative edge of the clock input.

### Features

- 650 MHz Maximum Clock Output Frequency
- CLK/ $\overline{\text{CLK}}$  can Accept LVPECL, LVDS, HCSL, STTL and HSTL
- PCLK/ $\overline{\text{PCLK}}$  can Accept LVPECL, LVDS, CML and SSTL
- Four Differential LVPECL Clock Outputs
- 1.5 ns Maximum Propagation Delay
- Operating Range:  $V_{CC} = 2.375 \text{ V}$  to  $3.630 \text{ V}$
- LVC MOS Compatible Control Inputs
- Selectable Differential Clock Inputs
- Synchronous Clock Enable
- 30 ps Max. Skew Between Outputs
- $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  Ambient Operating Temperature Range
- TSSOP-20 Package
- These are Pb-Free Devices

### Applications

- Computing and Telecom
- Routers, Servers and Switches
- Backplanes

### ORDERING INFORMATION

See detailed ordering and shipping information on page 8 of this data sheet.

# NB3L8533

Figure 2. Pinout Diagram (Top View)

Table 1. FUNCTIONS

Inputs			Outputs		
CLK_EN	CLK_SEL	Input Function	Output Function	Qx	Q $\bar{x}$
0	0	CLK input selected	Disabled	LOW	HIGH
0	1	PCLK Inputs Selected	Disabled	LOW	HIGH
1	0	CLK input selected	Enabled	CLK	Invert of CLK
1	1	PCLK Inputs Selected	Enabled	PCLK	Invert of PCLK

1. After CLK\_EN switches, the clock outputs are disabled or enabled following a rising and falling input clock edge as show in Figure 3.

Table 2. PIN DESCRIPTION

Pin Number	Name	I/O	Open Default	Description
1	VEE	Power		Negative (Ground) Power Supply pin must be externally connected to power supply to guarantee proper operation.
2	CLK_EN	LVC MOS/LVTTL Input	Pull-up	Synchronized Clock Enable when HIGH. When LOW, outputs are disabled (Qx HIGH, Qx LOW)
3	CLK_SEL	LVC MOS/LVTTL Input	Pull-down	Clock Input Select (HIGH selects PCLK, LOW selects CLK input)
4	CLK	Input	Pull-down	Non-inverted Differential Clock Input. Float open when unused.
5	$\overline{\text{CLK}}$	Input	Pull-up	Inverted Differential Clock Input. Float open when unused.
6	PCLK	Input	Pull-down	Non-inverted Differential Clock Input. Float open when unused.
7	$\overline{\text{PCLK}}$	Input	Pull-up	Inverted Differential Clock Input. Float open when unused.
8	NC			No Connect
9	NC			No Connect
10	VCC	Power		Positive Power Supply pins must be externally connected to power supply to guarantee proper operation.
11	$\overline{\text{Q3}}$	LVPECL Output		Complement Differential Output
12	Q3	LVPECL Output		True Differential Output
13	VCC	Power		Positive Power Supply pins must be externally connected to power supply to guarantee proper operation.
14	$\overline{\text{Q2}}$	LVPECL Output		Complement Differential Output
15	Q2	LVPECL Output		True Differential Output
16	$\overline{\text{Q1}}$	LVPECL Output		Complement Differential Output
17	Q1	LVPECL Output		True Differential Output
18	VCC	Power		Positive Power Supply pins must be externally connected to power supply to guarantee proper operation.
19	$\overline{\text{Q0}}$	LVPECL Output		Complement Differential Output
20	Q0	LVPECL Output		True Differential Output

# NB3L8533

**Table 3. ATTRIBUTES** (Note 2)

Characteristics		Value
ESD Protection	Human Body Model Machine Model	> 2 kV > 200 V
$R_{PU}$ – Pull-up Resistor		50 k $\Omega$
$R_{PD}$ – Pull-down Resistor		50 k $\Omega$
Moisture Sensitivity (Note 2)	TSSOP–20	Level 1
Flammability Rating	Oxygen Index: 28 to 34	UL 94 V–0 @ 0.125 in
Transistor Count		289
Meets or exceeds JEDEC Spec EIA/JESD78 IC Latchup Test		

2. For additional information, see Application Note AND8003/D.

**Table 4. MAXIMUM RATINGS**

Symbol	Parameter	Condition 1	Condition 2	Rating	Unit
$V_{CC}$	Positive Power Supply Voltage	$V_{EE} = 0\text{ V}$		4.6	V
$V_I$	Input Voltage	$V_{EE} = 0\text{ V}$	$V_I \leq V_{CC}$	–0.5 to $V_{CC} + 0.5$	V
$I_{out}$	Output Current	Continuous Surge		50 100	mA mA
$T_A$	Operating Temperature Range			–40 to +85	$^{\circ}\text{C}$
$T_{stg}$	Storage Temperature Range			–65 to +150	$^{\circ}\text{C}$
$\theta_{JA}$	Thermal Resistance (Junction–to–Ambient)	0 lfpm 500 lfpm	TSSOP–20 TSSOP–20	140 50	$^{\circ}\text{C}/\text{W}$
$\theta_{JC}$	Thermal Resistance (Junction–to–Case)	Standard Board	TSSOP–20	23 to 41	$^{\circ}\text{C}/\text{W}$
$T_{sol}$	Wave Solder			265	$^{\circ}\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

$I_{IH}$	Input HIGH Current $V_{IN} = V_{CC} = 3.630\text{ V}$	CLK_EN CLK_SEL		5 150	$\mu\text{A}$
$I_{IL}$	Input Low Current $V_{IN} = 0\text{ V}$ , $V_{CC} = 3.630\text{ V}$	CLK_EN CLK_SEL	-150 -5		$\mu\text{A}$

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

3. Input and Output parameters vary 1:1 with  $V_{CC}$ .
4. LVPECL outputs loaded with  $50\ \Omega$  to  $V_{CC} - 2\text{ V}$  for proper operation.
5.  $V_{IH}$ ,  $V_{IL}$ ,  $V_{th}$  and  $V_{ISE}$  parameters must be complied with simultaneously.
6.  $V_{th}$  is applied to the complementary input when operating in single-ended mode.
7.  $V_{IHD}$ ,  $V_{ILD}$ ,  $V_{ID}$  and  $V_{CMR}$  parameters must be complied with simultaneously.
8. The common mode voltage is defined as  $V_{IH}$ .

ODC	Output Clock Duty Cycle			47		53	%

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

All parameters measured at  $f_{MAX}$  unless noted otherwise.

The cycle-to-cycle jitter on the input will equal the jitter on the output. The part does not add jitter

9. Measured using a  $V_{INppmin}$  source, Reference Duty Cycle = 50% duty cycle clock source. All output loading with external  $50\ \Omega$  to  $V_{CC} - 2\text{ V}$ .

10. Measured from the differential input crossing point to the differential output crossing point.

11. Measured from  $V_{CC}/2$  input crossing point to the differential output crossing point.

12. Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the output differential cross points.

13. Defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

14. Output voltage swing is a single-ended measurement operating in differential mode.

15. Input voltage swing is a single-ended measurement operating in differential mode.

Figure 3. Typical Phase Noise Plot at  $f_{\text{carrier}} = 156.25 \text{ MHz}$  at an Operating Voltage of 3.3 V, Room Temperature

The above phase noise data was captured using Agilent E5052A/B. The data displays the input phase noise and output phase noise used to calculate the additive phase jitter at a specified integration range. The RMS Phase Jitter contributed by the device (integrated between 12 kHz and 20 MHz) is 51.76 fs.

The additive phase jitter performance of the fanout buffer is highly dependent on the phase noise of the input source.

To obtain the most accurate additive phase noise measurement, it is vital that the source phase noise be notably lower than that of the DUT. If the phase noise of the source is greater than the device under test output, the source noise will dominate the additive phase jitter calculation and lead to an artificially low result for the additive phase noise measurement within the integration range.

$$\text{RMS additive jitter} = \sqrt{\text{RMS phase jitter of output}^2 - \text{RMS phase jitter of input}^2}$$

$$51.76 \text{ fs} = \sqrt{100.24 \text{ fs}^2 - 85.84 \text{ fs}^2}$$
