

NCP4632

3A, Low Voltage, Low Dropout Linear Voltage Regulator with Reverse Current Protection

The NCP4632 is a CMOS Linear voltage regulator with high output current capability (up to 3 A). This device can provide output voltages as low as 0.8 V while maintaining a low dropout voltage of 510 mV typ. at full load. The NCP4632 is designed to draw only 350 μ A of supply current and less than 1 μ A in standby mode to minimize current consumption for battery operated applications. The device has a high accuracy output voltage of $\pm 1\%$ along with soft-start and reverse current protection circuits to protect the device and the application. The NCP4632 is available in a Pb-Free DPAK-5 package in both fixed and adjustable output voltage options. The output voltage for the fixed options can be modified in 0.1 V steps from 0.8 V to 4.2 V. Please contact your sales office for any additional fixed voltage outputs to those already listed.

Features

- Operating Input Voltage Range: 1.6 V to 5.25 V
- Output Voltage Range: 0.8 to 4.5 V (0.1 V steps for fixed options)
- Supply current: Typical Operation Mode – 350.0 μ A
Standby Mode – 1.0 μ A
- Dropout Voltage:
150 mV Typ. at $I_{OUT} = 1$ A, $V_{OUT} = 2.5$ V
510 mV Typ. at $I_{OUT} = 3$ A, $V_{OUT} = 2.5$ V
- $\pm 1\%$ Output Voltage Accuracy
- Line Regulation 0.15%/V Typ.
- Current Fold Back Protection Typ. 220 mA
- Stable with Ceramic Capacitors
- Available in DPAK-5 Package (TO252-5)
- These are Pb-Free Devices

Typical Applications

- Battery Powered Equipments
- Portable Communication Equipments
- Cameras, VCRs and Camcorders
- Home appliances

PIN FUNCTION DESCRIPTION

Pin No. TO252-5-P2	Pin Name	Description
4	VOUT	Output Voltage Pin
2	VIN	Input Voltage Pin
3	GND (Note 1)	Ground Pin
1	CE	Chip Enable Pin, Active "H", Connect to VIN pin if not used.
5	SENSE / ADJ	Sense Pin on Fixed Options, ADJ for Adjustable

1. TAB is internally connected to pin 3 GND.

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage	V_{IN}	6.0	V
Output Voltage	V_{OUT}	-0.3 to $V_{IN} + 0.3$	V
Chip Enable Input	V_{CE}	-0.3 to 6.0	V
Sense Input	V_{sense}	-0.3 to 6.0	V
Output Current	I_{OUT}	3000	mA
Power Dissipation (Note 2)	$P_{D(MAX)}$	3800	mW
Storage Temperature Range	T_{STG}	-55 to 125	$^{\circ}C$
Maximum Junction Temperature	$T_{J(MAX)}$	125	$^{\circ}C$
ESD Capability, Human Body Model (Note 3)	ESD_{HBM}	2000	V
ESD Capability, Machine Model (Note 3)	ESD_{MM}	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

2. JEDEC standard 76.2mm x 114.3 mm, FR4 Four-layers board

3. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)

Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

THERMAL CHARACTERISTICS

APPLICATION INFORMATION

A typical application circuit for NCP4632 series is shown in Figure 38.

Figure 38. Typical Application Schematic

Input Decoupling Capacitor (C1)

A 10 µF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4632. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 10 µF ceramic output decoupling capacitor is sufficient to achieve stable operation of the IC. If a tantalum capacitor is used, and its ESR is high, loop oscillation may result. Using multiple ceramic capacitors in parallel should be avoided if possible as this can lead to unstable operation. The Output capacitor should be connected as close as possible to the output and ground pin. Larger capacitance values and lower ESR improves dynamic parameters.

Enable Operation

The Enable pin (CE) may be used for turning the regulator on and off. The regulator is switched on when the CE pin voltage is above logic high level. The Enable pin has an internal pull down current source with a 300 nA current capability. If the enable function is not needed, connect CE pin to VIN pin.

Output Voltage Setting

For the Adjustable version of the NCP4632, the output voltage can be adjusted by using an external resistor divider. The output voltage can be calculated using Equation 1.

$$V_{OUT} = 0.8 \times \left(1 + \frac{R1}{R2}\right) + R1 \times I_{ADJ} \quad (\text{eq. 1})$$

The current consumption I_{ADJ} flowing into the ADJ pin can be described by Equation 2.

$$R1 \times I_{ADJ} = V_{SET} \times \frac{R1}{R_{ADJ}} \quad (\text{eq. 2})$$

By choosing $R1 \ll R_{ADJ}$ (R_{ADJ} is typically around 1.6 MΩ), this value becomes very small in which case we can omit the term $R1 \times I_{ADJ}$ in Equation 1. The simplified equation for the output voltage calculation is shown in Equation 3.

$$V_{OUT} = 0.8 \times \left(1 + \frac{R1}{R2}\right) \quad (\text{eq. 3})$$

The resistor divider should be kept to values below 500 kΩ to ensure stability.

Figure 39. Output Voltage Setting

Output Discharger

The D version includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal

As power across the IC increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature rise for the part. That is to say, when the device has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

NCP4632

PCB layout

Make VIN and GND line sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.

Reverse Current Protection

The NCP4632 device include a Reverse Current Protection Circuit, which stops a reverse current flowing from the VOUT pin to the VIN or GND pin when the voltage on VOUT becomes higher than VIN. The reverse current protection circuitry switches the output power device of the

regulator off as soon as VIN drops to < 30 mV above VOUT. In this state, reverse current is restricted to less than 10 μ A, which flows to ground. As VIN recovers, the power device is switched back on. In order to avoid unstable behavior, there is a 5 mV hysteresis incorporated in the design which will require the dropout to rise above 35 mV before the power device is switched on again. Therefore, the minimum voltage dropout of the device at small output current is limited to 35 mV. Figures 40 and 41 show the diagrams of both operating modes.
