

LDO Regulator - Very Low Dropout, CMOS, Bias Rail 1 A

NCP59771

The NCP59771 is a 1 A VLDO equipped with NMOS pass transistor and a separate bias supply voltage (V_{BIAS}). The device provides very stable, accurate output voltage with low noise suitable for space constrained, noise sensitive applications. In order to optimize performance for battery operated portable applications, the NCP59771 features low I_Q consumption. The WLCSP6 1.4 mm x 0.8 mm Chip Scale package is optimized for use in space constrained applications.

Features

- Input Voltage Range: V_{OUT} to 5.5 V
- Bias Voltage Range: 2.5 V to 5.5 V
- Adjustable Voltage Version Available
- Output Voltage Range: 0.4 V to 1.8 V (Fixed)
- Output Voltage Range: 0.4 V to 3.0 V (Adjustable)
- $\pm 1\%$ Accuracy over Temperature, $0.5\% V_{OUT}$ @ 25°C
- Ultra-Low Dropout: Typ. 50 mV at 1 A
- Very Low Bias Input Current of Typ. 80 μA
- Very Low Bias Input Current in Disable Mode: Typ. 0.5 μA
- Logic Level Enable Input for ON/OFF Control
- Output Active Discharge Option Available
- Stable with a 4.7 μF Ceramic Capacitor
- Available in WLCSP6 – 1.4 mm x 0.8 mm, 0.4 mm pitch Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Battery-powered Equipment
- Smartphones, Tablets
- Cameras, DVRs, STB and Camcorders

PIN FUNCTION DESCRIPTION

| Pin No. WLCSP6 | Pin Name | Description |
|-------------------|----------|--|
| A1 | OUT | Regulated Output Voltage pin |
| A2 | IN | Input Voltage Supply pin |
| B1 | FB | Feedback pin. Connect resistor divider to set requested output voltage. |
| B2 | EN | Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. |
| C1 | GND | Ground pin |
| C2 | BIAS | Bias voltage supply for internal control circuits. This pin is monitored by internal Under-Voltage Lockout Circuit. |

ABSOLUTE MAXIMUM RATINGS

| Rating | Symbol | Value | Unit |
|---|----------------------------|-------------------------------|------|
| Input Voltage (Note 1) | V_{IN} | -0.3 to 6 | V |
| Output Voltage | V_{OUT} | -0.3 to $(V_{IN}+0.3) \leq 6$ | V |
| Chip Enable, Bias and SNS Input | V_{EN}, V_{BIAS}, V_{FB} | -0.3 to 6 | V |
| Output Short Circuit Duration | t_{SC} | unlimited | s |
| Maximum Junction Temperature | T_J | 150 | °C |
| Storage Temperature | T_{STG} | -55 to 150 | °C |
| ESD Capability, Human Body Model (Note 2) | ESD_{HBM} | 2000 | V |
| ESD Capability, Machine Model (Note 2) | ESD_{MM} | 200 | V |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection (except OUT pin) and is tested by the following methods:
 ESD Human Body Model tested per EIA/JESD22-A114
 ESD Machine Model tested per EIA/JESD22-A115
 Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

THERMAL CHARACTERISTICS

| Rating | Symbol | Value | Unit |
|---|-----------------|-------|------|
| Thermal Characteristics, WLCSP6 1.4 mm x 0.8 mm Thermal Resistance, Junction-to-Air (Note 3) | $R_{\theta JA}$ | 69 | °C/W |

3. This junction-to-ambient thermal resistance under natural convection was derived by thermal simulations based on the JEDEC JESD51 series standards methodology. Only a single device mounted at the center of a high_K (2s2p) 80 mm x 80 mm multilayer board with 1-ounce internal planes and 2-ounce copper on top and bottom. Top copper layer has a dedicated 1.6 sqmm copper area.

| Output Discharge Pull-Down | $V_{\text{EN}} \leq 0.4\text{ V}$, $V_{\text{OUT}} = 0.5\text{ V}$, Only 'A' option | R_{DISCH} | | 150 | | Ω |
| Delay time | From assertion of V_{EN} to output voltage increase | t_{DELAY} | | 73 | | μs |
| Rise time | V_{OUT} rise from 10% to 90% $V_{\text{OUT(NOM)}}$ | t_{RISE} | | 15 | | |
| Turn-On Time | From assertion of V_{EN} to $V_{\text{OUT}} = 98\% V_{\text{OUT(NOM)}}$ | t_{ON} | | 98 | | |

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

4. Performance guaranteed over the indicated operating temperature range by design and/or characterization. Production tested at $T_A = 25^{\circ}\text{C}$.

Low duty cycle pulse techniques are used during the testing to maintain the junction temperature as close to ambient as possible.

5. Dropout voltage is characterized when V_{OUT} falls 3% below $V_{\text{OUT(NOM)}}$.

6. For output voltages below 1.5 V, V_{BIAS} dropout does not apply due to a minimum Bias operating voltage of 2.5 V.

TYPICAL CHARACTERISTICS

At $T_J = +25^\circ\text{C}$, $V_{IN} = V_{OUT(NOM)} + 0.3\text{ V}$, $V_{BIAS} = 2.8\text{ V}$, $V_{EN} = V_{BIAS}$, $V_{OUT(NOM)} = 1.2\text{ V}$, $I_{OUT} = 700\text{ mA}$, $C_{IN} = 4.7\text{ }\mu\text{F}$, $C_{BIAS} = 1\text{ }\mu\text{F}$, and $C_{OUT} = 10\text{ }\mu\text{F}$ (effective capacitance), unless otherwise noted.

APPLICATIONS INFORMATION

The NCP59771 dual-rail very low dropout voltage regulator is using NMOS pass transistor for output voltage regulation from V_{IN} voltage. All the low current internal control circuitry is powered from the V_{BIAS} voltage.

The use of an NMOS pass transistor offers several advantages in applications. Unlike PMOS topology devices, the output capacitor has reduced impact on loop stability.

V_{in} to V_{out} operating voltage difference can be very low compared with standard PMOS regulators in very low V_{in} applications.

The NCP59771 offers smooth monotonic start-up. The controlled voltage rising limits the inrush current.

The Enable (EN) input is equipped with internal hysteresis.

Figure 14. Typical Application Schematic

Output Voltage Adjustment

The required output voltage can be adjusted from 0.4 V to 3.0 V using two external resistors. Typical application schematic is shown on Figure 14. Output voltage is calculated according to Equation 1. When resistor’s value is in kΩ range last term ($I_{FB} \times R_1$) can be omitted because its

effect on output voltage accuracy is negligible. In other cases it should be consider especially when tight output voltage accuracy is requested.

$$V_{OUT} = V_{FB} \cdot \left(1 + \frac{R_1}{R_2} \right) + I_{FB} \cdot R_1 \quad (\text{eq. 1})$$

Voltage Calculation Example – $V_{OUT} = 0.8 \text{ V}$:

- a) $R_1 = R_2 = 5.1 \text{ k}\Omega$, no ($I_{FB} \times R_1$) $V_{OUT} = 0.4 \cdot \left(1 + \frac{5.1 \text{ k}\Omega}{5.1 \text{ k}\Omega} \right) = 0.8 \text{ V}$ Error – 0%
- b) $R_1 = R_2 = 5.1 \text{ k}\Omega$ $V_{OUT} = 0.4 \cdot \left(1 + \frac{5.1 \text{ k}\Omega}{5.1 \text{ k}\Omega} \right) + 100 \text{ nA} \cdot 5.1 \text{ k}\Omega = 0.80051 \text{ V}$ Error – 0.06%
- b) $R_1 = R_2 = 51 \text{ k}\Omega$ $V_{OUT} = 0.4 \cdot \left(1 + \frac{5.1 \text{ k}\Omega}{5.1 \text{ k}\Omega} \right) + 100 \text{ nA} \cdot 51 \text{ k}\Omega = 0.8051 \text{ V}$ Error – 0.63%

It is recommended to keep the total resistance of resistors ($R_1 + R_2$) no greater than a few hundred kΩ. If total resistance is too big the dynamic performance could get worse due to PCB parasitic capacitance. Big resistors value in combination with parasitic capacitance create low-pass filter and virtually slow-down LDO control loop.

OUTPUT VOLTAGE EXAMPLE

| V_{OUT} (V) | R_1 (kΩ) (Note 7) | R_2 (kΩ) (Note 7) | C_{FF} (nF) |
|---------------|---------------------|---------------------|---------------|
| 0.80 | 5.1 | 5.1 | 5.6 |
| 1.05 | 3.9 | 2.4 | 5.6 |
| 1.10 | 8.2 | 4.7 | 5.6 |
| 1.20 | 24 | 12 | 5.6 |

7. To increase power efficiency, current flows through resistor divider can be reduced by multiply all resistor values by 10.

NCP59771

Feed Forward Capacitor C_{FF}

Feed forward capacitor is recommended to improve PSRR, load transient and noise performance. Recommended value for NCP59771 device is about 5.6 nF. The capacitor can also improve LDO stability.

Dropout Voltage

Because of two power supply inputs V_{IN} and V_{BIAS} and one V_{OUT} regulator output, there are two Dropout voltages specified.

The first, the V_{IN} Dropout voltage is the voltage difference ($V_{IN} - V_{OUT}$) when V_{OUT} starts to decrease by percent specified in the Electrical Characteristics table. V_{BIAS} is high enough; specific value is published in the Electrical Characteristics table.

The second, V_{BIAS} dropout voltage is the voltage difference ($V_{BIAS} - V_{OUT}$) when V_{IN} and V_{BIAS} pins are joined together and V_{OUT} starts to decrease.

Input and Output Capacitors

The NCP59771 device is designed to be stable for ceramic output capacitors with Effective capacitance in the range from 4.7 μ F to 47 μ F. The device is also stable with multiple capacitors in parallel, having the total effective capacitance in the specified range.

In applications where no low input supplies impedance available (PCB inductance in V_{IN} and/or V_{BIAS} inputs as example), the recommended $C_{IN} = 1 \mu$ F and $C_{BIAS} = 0.1 \mu$ F or greater. Ceramic capacitors are recommended. For the best performance all the capacitors should be connected to the NCP59771 respective pins directly in the device PCB copper layer, not through vias having not negligible impedance.

When using small ceramic capacitor, their capacitance is not constant but varies with applied DC biasing voltage, temperature and tolerance. The effective capacitance can be much lower than their nominal capacitance value, most importantly in negative temperatures and higher LDO output voltages. That is why the recommended Output capacitor capacitance value is specified as Effective value in the specific application conditions.

Enable Operation

The enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet. To get the full functionality of Soft Start, it is recommended to turn on the V_{IN} and V_{BIAS} supply voltages first and activate the Enable pin no sooner than V_{IN} and V_{BIAS} are on their nominal levels. If the enable function is not to be used then the pin should be connected to V_{IN} or V_{BIAS} .

If the EN pin voltage is < 0.4 V the device is guaranteed to be disabled. The pass transistor is turned off so that there is virtually no current flow between the IN and OUT. The active discharge transistor is active (devices with Output Active Discharge feature only) so that the output voltage V_{OUT} is pulled down to GND through a 150 Ω resistor. In the disable state the device consumes as low as typ. 0.5 μ A from the V_{IN} and 0.5 μ A from V_{BIAS} . If the EN pin voltage > 0.9 V the device is guaranteed to be enabled. The NCP59771 regulates the output voltage and the active discharge transistor is turned off. The EN pin has internal pull-down current source with typ. value of 0.3 μ A which assures that the device is turned off when the EN pin is not connected.

Current Limitation

The internal Current Limitation circuitry allows the device to supply the full nominal current and surges but protects the device against Current Overload or Short.

Thermal Protection

Internal thermal shutdown (TSD) circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When TSD activated, the regulator output turns off. When cooling down under the low temperature threshold, device output is activated again. This TSD feature is provided to prevent failures from accidental overheating.

Activation of the thermal protection circuit indicates excessive power dissipation or inadequate heatsinking. For reliable operation, junction temperature should be limited to $+105^{\circ}\text{C}$ maximum.
