

5 kV_{RMS}, 4.5-A/9-A Isolated Single Channel Gate Driver

NCV51153

The NCV51153 is a family of isolated single-channel gate driver with 4.5-A/9-A source and sink peak current respectively. They are designed for fast switching to drive power MOSFETs, IGBTs and SiC MOSFET power switches. The NCV51153 offers short and matched propagation delays. The NCV51153xA provides a split output that controls the rise and fall times individually. The NCV51153xB has its V_{CC} UVLO referenced to GND2.

The NCV51153 is available in a wide body SOIC-8 package and can support isolation voltage up to 5 kV_{RMS}.

The NCV51153 offers other important protection function such as independent under-voltage lockout for primary and secondary side of the driver.

Features

- Feature Options
 - ◆ Separated Outputs (NCV51153xA)
 - ◆ Wide Bias Voltage Range Including Negative V_{EE} and V_{CC} UVLO Referenced to GND2 (NCV51153xB)
- 3-V to 20-V Input Supply Voltage
- Output Supply Voltage from 6.5 V to 30 V with 6-V and 9-V for MOSFET, 12-V and 17-V for SiC UVLO Threshold
- 4.5-A Peak Source, 9-A Peak Sink Output Current Capability
- 200 V/ns dV/dt Immunity
- Negative 5-V Handling Capability on Input Pins
- Propagation Delay Typical 36 ns with
 - ◆ 5 ns Max Delay Matching
- Gate Clamping During Short Circuit (NCV51153xA)
- AEC-Q100 Qualified for Automotive Application Requirements
- Isolation & Safety
 - ◆ 5 kV_{RMS} Isolation for 1 Minute (per UL1577 Requirements) (Planned)
 - ◆ 4242 V_{PK} Reinforced Isolation Voltage (per VDE0884-11 Requirements) (Planned)
 - ◆ CQC Certification per GB4943.1-2011 (Planned)
 - ◆ SGS FIMO Certification per IEC 62386-1 (Planned)

Typical Applications

- On-board Chargers
- xEV DC-DC Converters
- Traction Inverters
- Charging Stations

SOIC-8 WB
CASE 751EW

MARKING DIAGRAM

NCV51153 = Specific Device Code
 X = A or B or C or D for UVLO Option
 Y = A: Split Output, or B: VEE_GND2 for True UVLO

PIN CONNECTIONS

Figure 3. Pin Connections – SOIC-8 WB (Top View)

PIN FUNCTION DESCRIPTION

Pin Name	Pin No.		I/O	Description
	NCV51153xA	NCV51153xB		
V _{DD}	1	1	Power	Input-side Supply Voltage. It is recommended to place a bypass capacitor from V _{DD} to GND1.
IN+	2	2	Input	Non-inverting Logic Input with internal pull-down resistor to GND1.
IN-	3	3	Input	Inverting Logic Input with internal pull-up resistor to V _{DD} .
GND1	4	4	Power	Ground Input-side (all signals on input-side are referenced to this ground).
V _{CC}	5	5	Power	Positive Output Supply Rail.
OUTH	6	6	Output	Gate Drive Pull-up Output.
OUTL	7	–	Output	Gate Drive Pull-down Output.
GND2	–	7	Power	Gate-drive common pin. Connect this pin to the MOSFET source. V _{CC} UVLO with respect to GND2 for variant B.
V _{EE}	8	8	Power	Negative output supply rail for variant B and ground for variant A.

INSULATION RATINGS

Symbol	Parameter	Value	Unit
	Installation Classifications per DIN VDE 0110/1.89 Table 1 Rated Mains Voltage	<150 V _{RMS}	I–IV
		<300 V _{RMS}	I–IV
		<450 V _{RMS}	I–IV
		<600 V _{RMS}	I–IV
		<1000 V _{RMS}	I–III
CTI	Comparative Tracking Index (DIN IEC 112/VDE 0303 Part 1)	600	
	Climatic Classification	40/125/21	
	Pollution Degree (DIN VDE 0110/1.89)	2	
V _{PR}	Input-to-Output Test Voltage, Method b, V _{IORM} × 1.875 = V _{PR} , 100% Production Test with t _m = 1 s, Partial Discharge < 5 pC	2250	V _{PK}
V _{IORM}	Maximum Repetitive Peak Isolation Voltage	1200	V _{PK}
V _{IOWM}	Maximum Working Voltage	870	V _{RMS}
V _{IOTM}	Maximum Transient Isolation Voltage	8400	V _{PK}
E _{CR}	External Creepage	8.0	mm
E _{CL}	External Clearance	8.0	mm
DTI	Insulation Thickness	17.3	μm
R _{IO}	Insulation Resistance at T _S , V _{IO} = 500 V	10 ⁹	Ω

SAFETY LIMITING VALUE

Symbol	Parameter	Test Condition	Side	Value	Unit
P _S	Safety Supply Power	R _{θJA} = 100 °C/W, T _A = 25 °C, T _J = 150 °C	INPUT	0.21	W
			OUTPUT	1.04	W
			TOTAL	1.25	W
T _S	Safety Temperature			150	°C

MAXIMUM RATINGS

Symbol		Parameter	Min	Max	Unit
V _{DD} to GND1		Power Supply Voltage – Input Side (Note 2)	–0.3	25	V
V _{CC} – GND2		Positive Supply Voltage – Driver Side	–0.3	33	V
VEE – GND2		Negative Supply Voltage for Only B Version (Note 3)	–18	0.3	V
V _{CC} – VEE		Differential Supply Voltage – Driver Side (Note 3)	–0.3	33	V
OUT to VEE		Driver Output Voltage (Note 3)	V _{EE} – 0.3	V _{CC} + 0.3	V
OUT to VEE, Transient for 200 ns (Note 4)			V _{EE} – 2	V _{CC} + 0.3	V
IN+, and IN–		Input Signal Voltages (Note 2)	–5	V _{DD} + 0.3	V
T _J		Junction Temperature	–40	+150	°C
T _S		Storage Temperature	–65	+150	°C
Electrostatic Discharge Capability	HBM (Note 5)	Human Body Model	–	2	kV
	CDM (Note 5)	Charged Device Model	–	1	kV

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe Operating parameters.
2. All voltage values are given with respect to GND1 pin.
3. All voltage values are given with respect to VEE pin.
4. This parameter verified by design and bench test, not tested in production.
5. This device series incorporates ESD protection and is tested by the following methods:
ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
ESD Charged Device Model tested per AEC-Q100-011 (EIA/JESD22-C101)
Latch up Current Maximum Rating: ≤100 mA per JEDEC standard: JESD78F.

THERMAL CHARACTERISTICS

Symbol	Parameter	PCB	Value	Unit
θ_{JA}	Secondary Thermal Resistance of Junction-Air (Note 6)	Type-A (Note 6)	100	$^{\circ}\text{C/W}$
		Type-B (Note 7)	115	
Ψ_{JT}	Thermal Characterization Parameter Junction-Case Top	Type-A (Note 6)	13	
		Type-B (Note 7)	13	
P_D	Secondary Power Dissipation (Note 6)	Type-A (Note 6)	1.25	W
		Type-B (Note 7)	1.08	

6. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe Operating parameters.
7. As specified for a reference layout shown in Figure 4. The DUT is mounted on a 65 x 40 x 1.6 mm FR4 substrate with an additional heat spreading copper of 240 mm²/300 mm² (Primary/Secondary). The copper thickness is 1 oz and test conditions is under natural convection or zero air flow.

Figure 4. Reference Layout for the Type-A

8. As specified for a reference layout shown in Figure 5. The DUT is mounted on a 65 x 40 x 1.6 mm FR4 substrate with an additional heat spreading copper of 240 mm²/300 mm² (Primary/Secondary). The copper thickness is 1oz and test conditions is under natural convection or zero air flow.

Figure 5. Reference Layout for the Type-B

RECOMMENDED OPERATING CONDITIONS

Symbol	Rating		Min	Max	Unit
V _{DD}	Power Supply Voltage – Input Side		3.0	20	V
V _{CC}	Power Supply Voltage – Driver Side (Note 9)	6–V UVLO Version	6.5	30	V
		9–V UVLO Version	9.5	30	V
		12–V UVLO Version	13.5	30	V
		17–V UVLO Version	18.5	30	V
VEE – GND2	Negative Supply Voltage for only Variant B (NCV51153xB)		–15	0	V
V _{IN}	Logic Input Voltage at Pins IN+, and IN–		0	V _{DD}	V
T _A	Ambient Temperature		–40	+125	°C
T _J	Junction Temperature		–40	+125	°C
CMTI	Common Mode Transient Immunity		200	–	kV/μs

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

9. All V_{CC} UVLO threshold voltages of the variant A and B are given with respect to V_{EE} and GND2 pins respectively.

ISOLATION CHARACTERISTICS

Symbol	Parameter	Condition	Value	Unit
V _{ISO, INPUT TO OUTPUT}	Input to Output Isolation Voltage	T _A = 25 °C, Relative Humidity < 50%, t = 1.0 minute, I _{I-O} < 30 μA, 50 Hz (Note 10,11,12)	5000	V _{RMS}
R _{ISO}	Isolation Resistance	V _{I-O} = 500 V (Note 10)	10 ¹¹	Ω

10. Device is considered a two-terminal device: pins 1 to 4 are shorted together and pins 5 to 8 are shorted together.

11. 5,000 V_{RMS} for 1–minute duration is equivalent to 6,000 V_{RMS} for 1–second duration for input to output isolation test, and Impulse Test > 10 ms; sample tested for between channel isolation test.

12. The input-output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input-output continuous voltage rating. For the continuous working voltage rating, refer to equipment-level safety specification or DIN VDE V 0884-11 Safety and Insulation Ratings Table.

ELECTRICAL CHARACTERISTICS

$V_{DD} = 5\text{ V}$, $V_{CC} = 15\text{ V}$, or 20 V ($V_{EE} = 0\text{ V}$ for NCV51153xB) (Note 14) for typical values $T_J = T_A = 25\text{ }^{\circ}\text{C}$, for min/max values $T_J = -40\text{ }^{\circ}\text{C}$ to $+125\text{ }^{\circ}\text{C}$, unless otherwise specified. (Note 14))

SHORT CIRCUIT SECTION

$V_{CLP-OUT}$	Clamping Voltage, Sourcing ($V_{OUTH} - V_{CC}$ or $V_{OUT} - V_{CC}$)	$IN+ = \text{High}$, $IN- = \text{Low}$, $t_{CLAMP} = 10\text{ }\mu\text{s}$ I_{OUTH} or $I_{OUT} = 500\text{ mA}$	–	0.7	1.75	V
	Clamping Voltage, Sinking ($V_{EE} - V_{OUTL}$ or $V_{EE} - V_{OUT}$)	$IN+ = \text{Low}$, $IN- = \text{High}$, $t_{CLAMP} = 10\text{ }\mu\text{s}$ I_{OUTH} or $I_{OUT} = -500\text{ mA}$	–	0.24	0.5	V

GATE DRIVE SECTION

I_{OUT+}	Source Peak Current (Note 15)	$V_{IN+} = 5\text{ V}$, $PW \leq 5\text{ }\mu\text{s}$	2.6	4.5	–	A
I_{OUT-}	Sink Peak Current (Note 15)	$V_{IN+} = 0\text{ V}$, $PW \leq 5\text{ }\mu\text{s}$	7.0	9.0	–	A
R_{OH}	Output Resistance at High State	$I_{OUTH} = 100\text{ mA}$	–	1.4	2.8	Ω
R_{OL}	Output Resistance at Low State	$I_{OUTL} = 100\text{ mA}$	–	0.5	1.0	Ω
V_{OH}	High Level Output Voltage ($V_{CC} - V_{OUT}$)	$I_{OUTH} = 100\text{ mA}$	–	140	280	mV
V_{OL}	Low Level Output Voltage ($V_{OUT} - V_{EE}$)	$I_{OUTL} = 100\text{ mA}$	–	50	100	mV

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

13. Performance guaranteed over the indicated operating temperature range by design and/or characterization tested at $T_J = T_A = 25\text{ }^{\circ}\text{C}$.

14. $V_{CC} = 15\text{ V}$ is used for the test condition of 5-V, and 8-V UVLO, $V_{CC} = 20\text{ V}$ is used for 12-V and 17-V UVLO.

15. These parameters verified by bench test only and not tested in production

DYNAMIC ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Condition	Min	Typ	Max	Unit
t_{PDON}	Turn-On Propagation Delay from IN to OUT	$C_{LOAD} = 0\text{ nF}$	20	36	55	ns
t_{PDOFF}	Turn-Off Propagation Delay from IN to OUT		20	36	55	ns
t_{PWD}	Pulse Width Distortion ($t_{PDON} - t_{PDOFF}$)		–5	–	5	ns
$t_{SK(PP)}$	Propagation Part-to-part Skew (Note 16)		–20	–	20	ns
$t_{VPOR\text{ to }OUT}$	Power-up Delay from the V_{POR} to Output (Note 16)	See the Figure 47	–	18	–	μs
t_R	Turn-On Rise Time	$C_{LOAD} = 1.8\text{ nF}$	–	12	22	ns
t_F	Turn-Off Fall Time	$C_{LOAD} = 1.8\text{ nF}$	–	8.3	22	ns
t_{PW}	Minimum Input Pulse Width that Change Output State	$C_{LOAD} = 0\text{ nF}$	–	15	35	ns

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

16. These parameters verified by bench test only and not tested in production

PARAMETER MEASUREMENT DEFINITION

Switching Time Definitions

Figure 44 shows the switching time waveforms definitions of the turn-on (t_{PDON}) and turn-off (t_{PDOFF})

propagation delay times among the driver's input signal $IN+$ and output signal OUT . The typical values of the propagation delay (t_{PDON} , t_{PDOFF}), pulse width distortion (t_{PWD}) and delay matching between channel times are specified in the electrical characteristics table.

Figure 44. Switching Time Definition

Input to Output Operation Definitions

The NCV51153 provides important protection functions such as independent under-voltage lockout for gate driver. Figure 45 shows an overall input to output timing diagram. Under-Voltage Lockout protection on the primary and

secondary-side power supplies events in the *CASE-A, B and C* and the gate driver output (OUT) is immediately turned off when two input signal ($IN+$ and $IN-$) are HIGH at same time in the *CASE-D*.

Figure 45. Overall Operating Waveforms Definitions

PROTECTION FUNCTION

The NCV51153 provides the protection features including Under-Voltage Lockout (UVLO) of power supplies on primary-side (V_{DD}) and secondary-side (V_{CC}).

Under-Voltage Lockout Protection V_{DD} and V_{CC}

The NCV51153 provides the Under-Voltage Lockout (UVLO) protection function for V_{DD} in primary-side and gate drive output for V_{CC} in secondary-side as shown in Figure 46. The gate driver is running when the V_{DD} supply voltage is greater than the specified under-voltage lockout threshold voltage (e.g. typically 2.8 V).

In addition, gate output driver has an under-voltage lockout protection (UVLO) function in secondary-side (e.g. V_{CC}).

The variant A and B need to be greater than specified UVLO threshold level with respect to V_{EE} and GND2

respectively to let the output operate per input signal. The typical V_{CC} UVLO threshold voltage levels for each option respectively as are per Table 1.

Table 1. V_{CC} UVLO OPTION TABLE

Option	V_{CC} UVLO Threshold	V_{CC} UVLO Referenced		Unit
		Variant A	Variant B	
6-V	6.0	V_{EE}	GND2	V
9-V	8.7	V_{EE}	GND2	V
12-V	12	V_{EE}	GND2	V
17-V	17	V_{EE}	GND2	V

UVLO protection has the hysteresis to provide immunity to short V_{CC} drops that can occur.

Figure 46. Timing Chart Under-Voltage Lockout Protection

Power-up V_{CC} UVLO Delay to OUTPUT

To provide a variety of Under-Voltage Lockout (UVLO) thresholds NCV51153 has a power-up delay time during initial V_{CC} start-up or after POR event.

Before the gate driver is ready to deliver a proper output state, there is a power-up delay time from the V_{CC} power-on reset (POR) threshold to output and it is defined as $t_{VPOR\text{ to OUT}}$ (e.g. typically 18 μs). Figure 47 shows the V_{CC} power-up UVLO delay time diagram.

Figure 47. V_{CC} Power-up UVLO Delay Time

FUNCTIONAL MODES TABLE

Table 2 and Table 3 shows the functional modes for the NCV51153 variant A and B assuming V_{DD} and V_{CC} are in the recommended range.

Table 2. FUNCTIONAL MODES FOR THE VARIANT A

Input		Gate Drive Output	
IN+	IN-	OUTH	OUTL
LOW	X (Note 17)	Hi-Z	LOW
X (Note 17)	HIGH	Hi-Z	LOW
HIGH	LOW	HIGH	Hi-Z

Table 3. FUNCTIONAL MODES FOR THE VARIANT B

Input		Gate Drive Output
IN+	IN-	OUT
LOW	X (Note 17)	LOW
X (Note 17)	HIGH	LOW
HIGH	LOW	HIGH

17.X: Don't care

APPLICATION INFORMATION

This section provides application guidelines when using the NCV51153.

Power Supply Recommendations

The NCV51153 variant A and B are designed to support unipolar or bipolar power supply respectively.

The V_{DD} input power supply supports a wide voltage range from 3 V to 20 V and the V_{CC} output supply supports a voltage range from 6.5 V to 30 V. The V_{CC} local bypass capacitor should be placed between the V_{CC} and V_{EE} pins with a value of at least ten times the gate capacitance, and an additional capacitor 100-nF in parallel for device biasing and both capacitors located as close to the device as possible. A low ESR, ceramic surface mount capacitors are recommended. Additionally, for the negative bias supply capacitor should be placed between $GND2$ and V_{EE} pins with a value of at least few hundred nanofarads (variant B).

Similarly, the V_{DD} bypass capacitor should also be placed between the V_{DD} and $GND1$ pins for input logic power supply. We recommend using 2 capacitors; at least 100 nF ceramic surface-mount capacitor with few microfarads added in parallel and both capacitors also located as close to the pins of the device as shown in Figure 48.

- In Unipolar power supply the driver is typically supplied with a positive voltage at V_{CC} . For operation with unipolar supply, the V_{CC} supply is connected to 15 V with respect to V_{EE} pin for IGBTs and MOSFET and 20 V for SiC MOSFETs (variant A).

- In bipolar power supply the driver is typically supplied of the V_{CC} and V_{EE} power supplies. Typical supply values for bipolar operation are 15 V and -8 V with respect to $GND2$ for IGBTs and 20 V and -5 V for SiC MOSFETs. Negative power supply prevents the power device from unintentionally turning on because of current induced from the Miller effect (variant B).

Input Stage

Figure 48. Schematic of Input Stage

The input signal pins (IN+, and IN-) of the NCV51153 are based on the TTL compatible input-threshold logic that is independent of the V_{DD} supply voltage.

The logic level compatible input provides a typically HIGH and LOW threshold of 1.6 V and 1.1 V respectively.

The input signal pins impedance is 125 kΩ typically and the IN+ pin is pulled to $GND1$ pin and IN- pin is pulled to V_{DD} pin as shown in Figure 48. For non-inverting input logic input signal is applied to IN+ while the IN- input can be used as an enable function. If IN- is pulled HIGH, the driver output remains LOW state regardless of the state of IN+. To enable the driver output, IN- should be tied to $GND1$ through a few tens of kΩ resistor (e.g. 10 kΩ) or can be used as an active LOW enable pull down.

- Non-inverting input IN+ controls the driver output while inverting input IN- is set to LOW
- Inverting input IN- controls the driver output while non-inverting input IN+ is set to HIGH

An RC filter is recommended to be added on the input signal pins to reduce the impact of system noise and ground bounce as shown in Figure 48. Such a filter should use an R_{IN} in the range of 0 Ω to 100 Ω and a C_{IN} between 10 pF and 100 pF.

Output Stage

The NCV51153 have different output stages of the variant A and B as shown in Figure 49.

For the variant A is designed to support separate source (OUTH) and sink (OUTL) outputs. This scheme allows a single resistor between each pin and the MOSFET gate to independently control gate ringing as well as fine tuning dV_{DS}/dT turn-on and turn-off transitions present on the MOSFET drain-source voltage.

Figure 49. Schematic of Output Stage

The output impedance of the pull up and pull down switches shall be able to provide about +4.5 A and -9 A peak currents typical at 25 °C and the minimum sink and source peak currents are -7 A sink and +2.6 A source at 125 °C.

Common Mode Transient Immunity Testing

Figure 50 shows a simplified diagram of the Common Mode Transient Immunity (CMTI) testing configuration for each the variant A and B. CMTI is the maximum sustainable common-mode voltage slew rate while maintaining the correct output. CMTI applies to both rising and falling common-mode voltage edges. CMTI is tested with the transient generator connected between GND1 and V_{EE} ($V_{CM} = 1500$ V).

Figure 50. Common Mode Transient Immunity Test Circuit

PCB Layout Guideline

To improve the switching characteristics and efficiency of the design, the following should be considered before beginning a PCB layout.

Component Placement

- Keep the input/output traces as short as possible. Minimize influence of the parasitic inductance and capacitance on the layout. (To maintain low signal-path inductance, avoid using via).
- Placement and routing for supply bypass capacitors for V_{DD} , V_{CC} , V_{EE} and gate resistors need to be located as close as possible to the gate driver.
- The gate driver should be located to the switching device as close as possible to decrease the trace inductance and avoid output ringing.

Grounding Consideration

- Have a solid ground plane underneath the high-speed signal layer.

High-Voltage (VISO) Consideration

- To ensure isolation performance between the primary and secondary side, any PCB traces or copper should not be placed under the driver device as shown in Figure 51. A PCB cutout is recommended to avoid contamination that may impair the isolation performance of NCV51153.

Figure 51. Recommended Layer Stack

Figure 52 shows the 3D layout of the top view of an evaluation board. The component's location of the PCB cutout between primary and secondary side ensures isolation performance.

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.10 mm IN EXCESS OF MAXIMUM MATERIAL CONDITION.
4. DIMENSIONS D AND E DO NOT INCLUDE MOLD FLASH, PROTRUSIONS, OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.15 mm PER SIDE. DIMENSIONS D AND E ARE DETERMINED AT DATUM H.
5. DATUMS A AND B ARE TO BE DETERMINED AT DATUM H.
6. A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.
7. NO JEDEC STANDARD AT TIME OF SETUP.
