CAPACITOR: size 1005

PRECAUTIONS

- [1] The external capacitors should be connected to the input and output RF terminals (P₁, P₂, P_C) to block DC current. Please use a 0.01uF capacitor at 50 to 100MHz, a 0.1uF capacitor at 100 to 500MHz, and 56pF at 500MHz to 2.0GHz.
- [2] To avoid coupling between terminals, the capacitors have to be placed at the control terminals (V_{CTR1}, V_{CTR2}) as close as possible. The capacitor values of 0.01uF at 50 to 100MHz, 100pF at 100 to 500MHz, and 10pF at 500MHz to 2GHz are desired. In general, the switching time is depend on the capacitor values, so please be careful choosing capacitor values.
- [3] For good isolation characteristics, the ground terminals (2, 3, 5, 6, 9~13 pin) should be directly connected to the ground patterns and through-holes as close as possible using relatively wide patterns.

APPLICATION CIRCUIT 1: Single control signal operation by using C-MOS inverter
(frequency: 0.1~2.0GHz)

- [1] Please connect the bypass capacitor to the power supply terminal of the C-MOS inverter.
- [2] In order to stabilize the input impedance of inverter, the input terminal of the C-MOS inverter should be pulled down by the resistor of 510KΩ to the ground plane.
