PRECAUTIONS

- [1] No DC block capacitors are required for RF ports unless DC is biased externally. When the other device is biased at certain voltage and connected to the NJG1684ME2, a DC block capacitor is required between the device and the switch IC. This is because the each RF port of NJG1684ME2 is biased at 0 V (GND).
- [2] For good RF performance, all GND terminals must be connected to PCB ground plane of substrate, and via-holes for GND should be placed near the IC.
- [3] For good RF performance, through-holes for GND should be placed close to the GND pin 6 and pin 13. One of the ways to do this is to place a via-hole at the TAB pad under this IC.
