

POWER FACTOR CONTROLLER

■ GENERAL DESCRIPTION

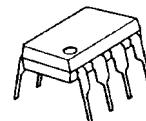

The NJM2375/A are active power factor controllers, which limit the harmonic current resulting from the power supply block of electrical devices.

They include a startup timer, an one quadrant multiplier, a zero current detector to ensure critical condition operation, a transconductance error amplifier, high precision reference, a current sensing comparator, and a totem pole output ideally suited for driving a power MOSFET.

They also contain protection circuits for overvoltage, cycle-by-cycle overcurrent, and maximum peak current.

The startup threshold of NJM2375A is lower than that of NJM2375.

■ PACKAGE OUTLINE

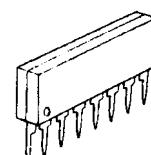

NJM2375D/AD

NJM2375M/AM

NJM2375V/AV

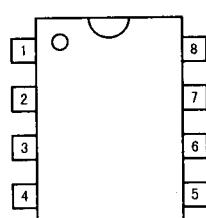

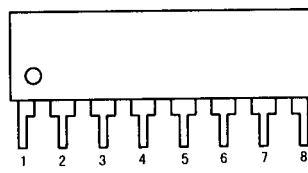

NJM2375L/AL

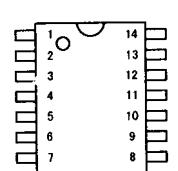

■ FEATURES

- Overvoltage Comparator Eliminates Runaway Output Voltage
- Internal Quick Start
- Internal Startup Timer
- One Quadrant Multiplier
- Zero Current Detector
- High Precision Reference ($\pm 2\%$)
- Totem Pole Output with High State Clamp
- Undervoltage Lockout
(Startup Threshold/NJM2375:13V typ., NJM2375A:10.4V typ.)
- Low Startup and Operating Current
- Bipolar Technology
- Package Outline DIP8,DMP8,SSOP14,SIP8

Power Supply Zener Voltage ^{*4}	V_Z	$I_{CC} = 25mA$	30	36	-	V

● NOTES

*¹ : Adjust V^+ above the startup threshold before setting to 12V.

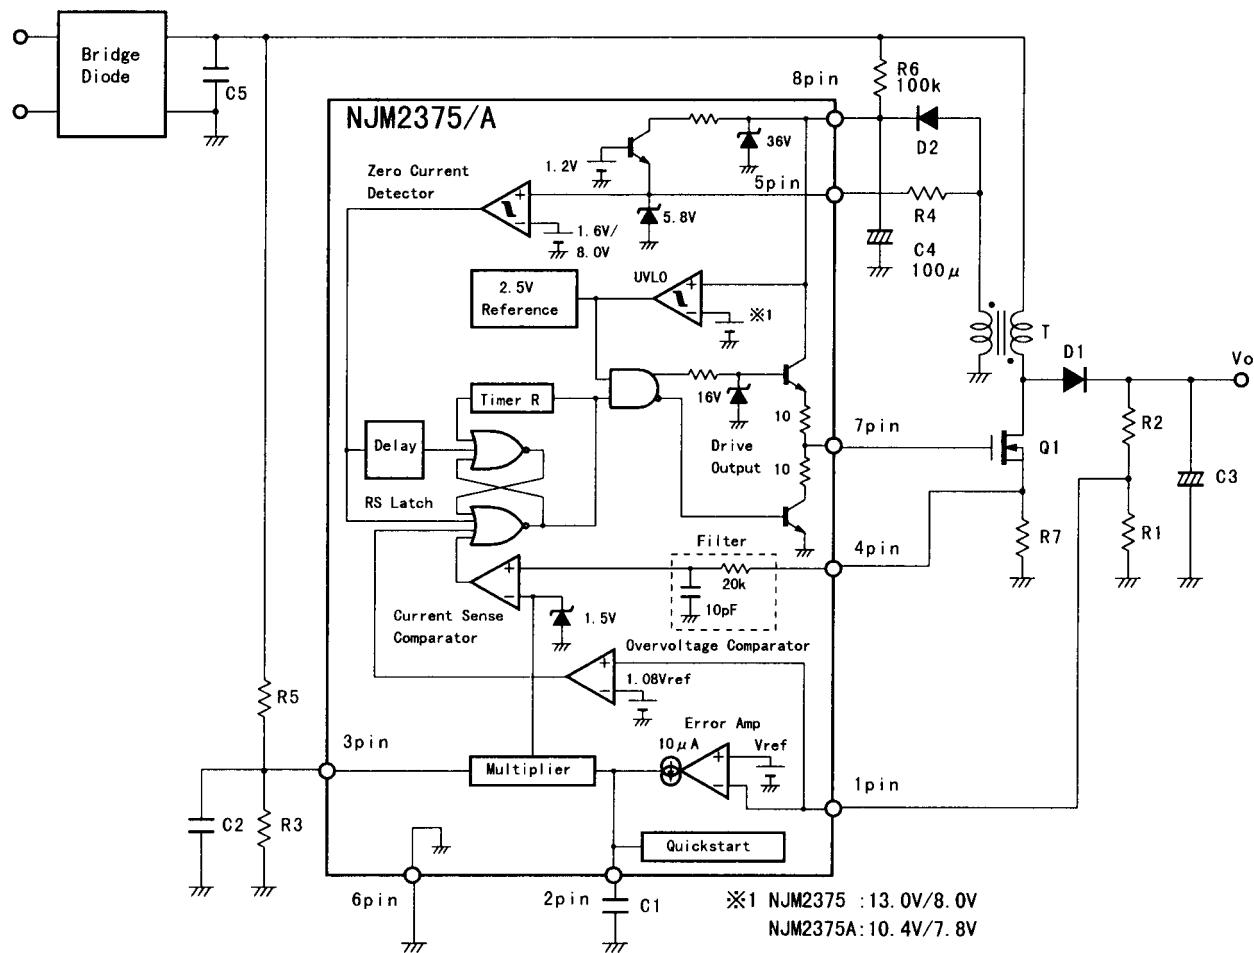

$$*^2 : K = \frac{V_{th(max)}}{V_M \times (V_{comp} - V_{th(M)})}$$

*³ : This parameter is measured with $V_{FB} = 0V$, and $V_M = 3.0V$.

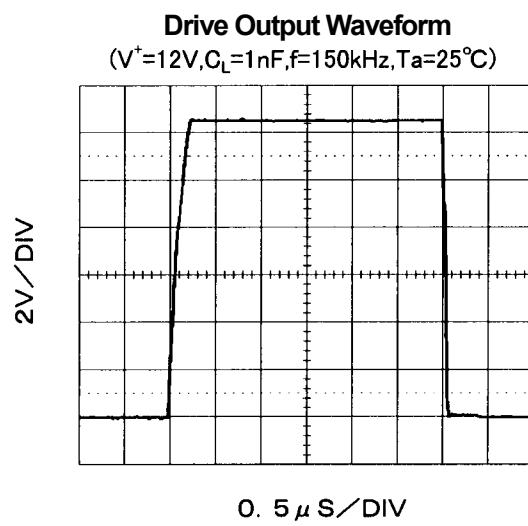

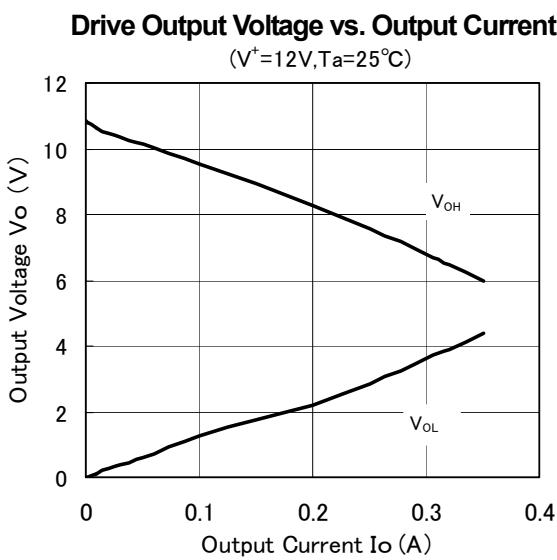

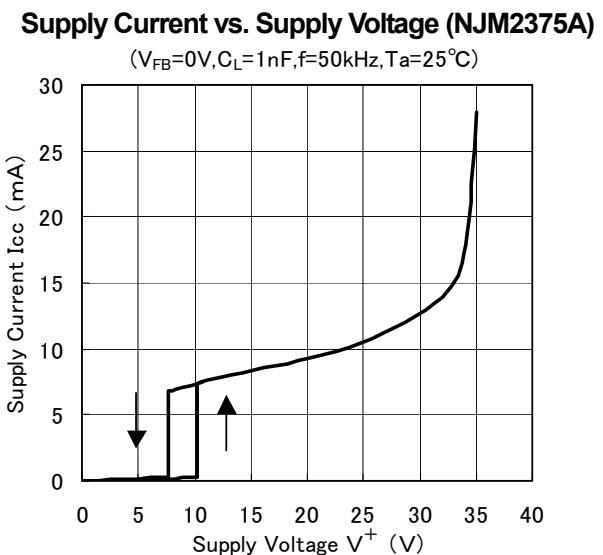

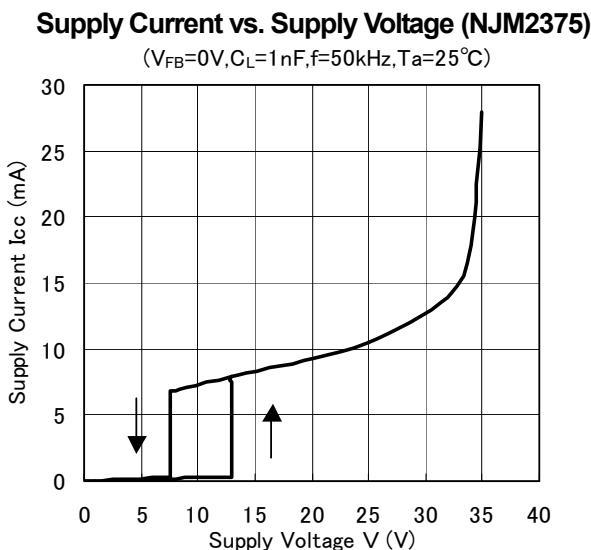

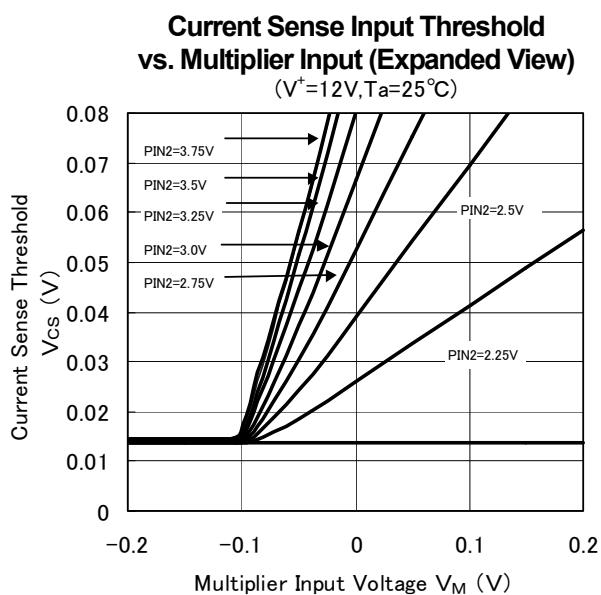

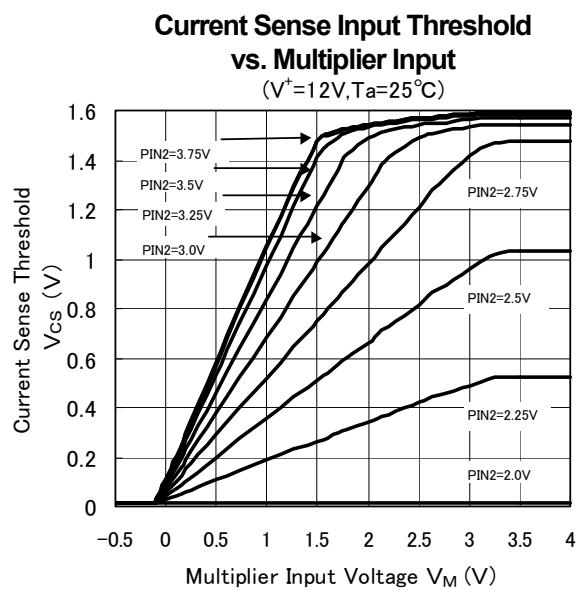

*⁴ : Do not supply higher voltage above the zener voltage to 8pin, because the internal zener diode protects the IC from surge.
