2Vrms Ground Referenced Stereo Line Amplifier with LPF

■ GENERAL DESCRIPTION

The **NJU72010** is an audio line Amplifier .

It can swing 2Vrms (5.6V peak-to-peak) signal at 3.3V operating voltage.

Ground-referenced outputs eliminate output coupling capacitor. The pop noise suppression circuit removes a pop noise at the power-on and power-off.

It is suitable for audio line interface of audio equipment which does not have over 9V regulator.

■ APPLICATIONS

● Audio applications requiring 2Vrms outputs

■ FEATURES

● Operating Voltage	+2.7 to +3.6V
● Operating Current	I_{DD}=5mA typ. at V^+=3.3V, R_L=47kΩ, No Signal
● Output Coupling Capacitor-less	
● Pop Noise Suppression Circuit	
● LPF	
● C-MOS Technology	
● Package Outline	TVSP10, SSOP14

■ APPLICATION NOTE

The NJU72010 is an audio line amplifier that eliminates the need for external dc-blocking output capacitors. The NJU72010 has built-in pop suppression circuitry to eliminate disturbing pop noise during power-on, power-off and mute-control.

1. Operating Principle

The NJU72010 has the built-in non-inverted input operational amplifiers, voltage inverter, and pop noise suppression circuitry (Fig.1).

The voltage inverter for NJU72010 eliminates the need for external dc-blocking output capacitors. The pop suppression circuitry for NJU72010 eliminates the pop noise during power-on, power-off and mute-control.

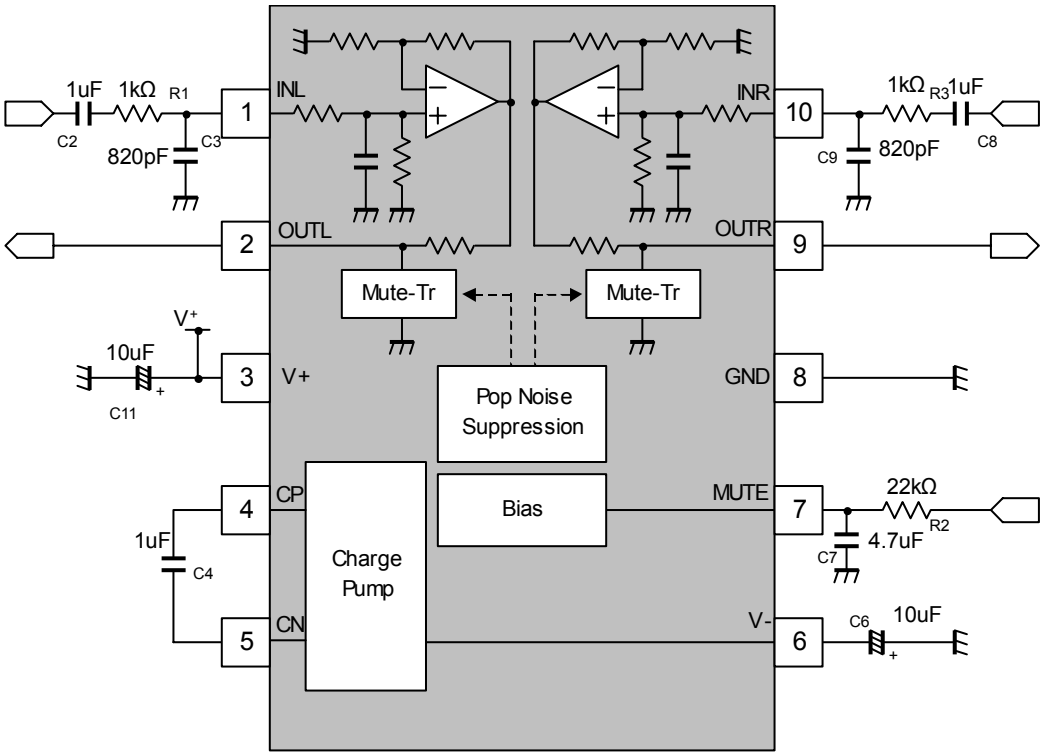

Fig.1 The NJU72010 functional block diagram

1.1 External parts

1.1.1 Input coupling capacitors C_i (C2, C8)

The input coupling capacitor (C_i) and the total of the external resistance (R1, R3) and the input resistance (R_{in}=218kΩ typ.) for the non-inverted terminal form a high-pass filter with the corner frequency determined in [$fc=1/(2\pi \times (R1+218k\Omega) \times C_i)$). It is necessary to adjust 1uF or more.

1.1.2 Flying capacitor (C4)

Use capacitors with a low-ESR (ex. ceramic capacitors) for optimum performance. Design to provide low impedance for the wiring between CP terminal (4pin), CN terminal (5pin), and the flying capacitor (C4).

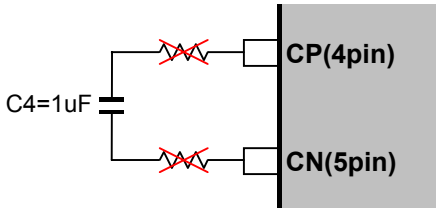

Fig.2 The NJU72040 block diagram (4pin, 5pin)

1.1.3 Hold capacitor (C6)

Use capacitors with a low-ESR (ex. ceramic capacitors) for optimum performance. Design to provide low impedance for the wiring between the hold capacitor (C6), V- terminal (6pin) and the GND on the PCB.

Separate the GND pattern connecting to the hold capacitor (C6) from that connecting to the GND terminal (8pin), thus suppressing the influence of switching noise by removing the common impedance of the GND wiring.

Design no short-circuits of V- terminal (6pin) and V+ terminal (3pin) on the PCB pattern.

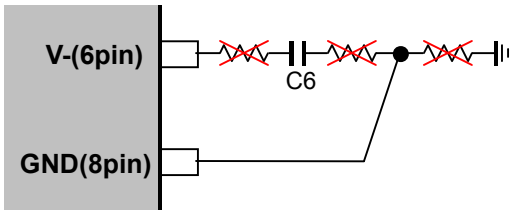

Fig.3 The NJU72010 block diagram (6pin, 8pin)

1.1.4 Mute terminal pop noise countermeasures (R2, C7)

Mute terminal needs time constant more than R2 x C7=0.1. It is necessary to adjust 22kΩ or less.

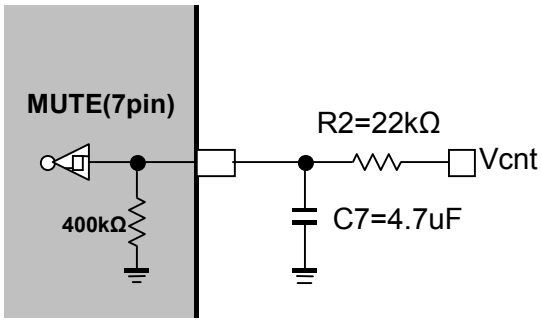

Fig.4 The NJU72010 block diagram (7pin)

1.2 Control of V+ terminal and Mute terminal

1.2.2 Power-on procedure

1. Turn on the V+.
2. After 100msec from power on, change the control voltage of MUTE terminal (Vcnt) from "Low" to "High".

* It is necessary to stabilize an IC for 100msec.

By releasing the MUTE function, the output terminal output the signal.

1.2.3 Power-off procedure

1. Change the control voltage of MUTE terminal (Vcnt) from "High" to "Low".

By the MUTE function, the output signals are stopped from output terminal.

2. Turn off the V+ after “2RC” sec from MUTE.

* It is necessary to stabilize a MUTE condition for “2RC” sec.

Ex.) R2=22kΩ, C7=4.7uF -> 2R2 x C7=200msec
