

Low Dropout Voltage Regulator with Reset

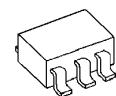

■ GENERAL DISCRIPTION

The NJU7271 is a low drop out voltage regulator with output-monitor reset function. Advanced CMOS technology achieves ultra low current consumption and high accuracy.

It delivers up to 5V/100mA output power with the maximum input voltage of 9V.

The NJU7270 is suitable for MPU applications.

■ PACKAGE OUTLINE

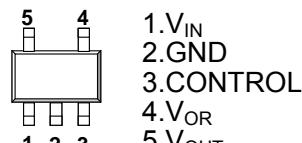

NJU7271F

■ FEATURES

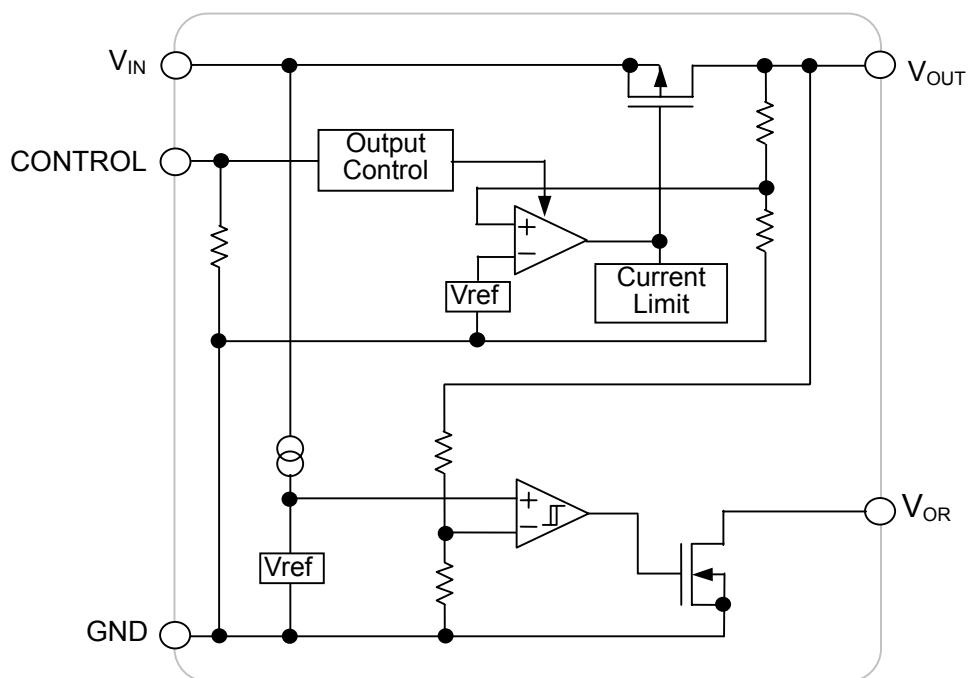

- Ultra Low Quiescent Current $I_q = 3.0\mu A$ typ. ($I_o = 0mA$)
- Output Voltage Accuracy $V_o = \pm 1.0\%$
- Reset Voltage Accuracy $V_{RT} = \pm 1.0\%$
- Output Voltage Monitor type
- Output Current $I_o(\max.) = 100mA$
- Output capacitor with $0.1\mu F$ ceramic capacitor
- Nch Open Drain Output
- Internal Short Circuit Current Limit
- CMOS Technology
- Package Outline SOT-23-5

■ TYPICAL APPLICATION

- ① In case that ON/OFF Control is not required:

Connect control terminal to V_{IN} terminal.

- ② In use of ON/OFF Control:

State of control terminal:

- “H” → output is enabled.
- “L” or “open” → output is disabled.

*Input Capacitance C_{IN}

Input Capacitance C_{IN} is required to prevent oscillation and reduce power supply ripple for applications with high power supply impedance or a long power supply line.

Use the C_{IN} value of $0.1\mu F$ greater to avoid the problem.

C_{IN} should connect between GND and V_{IN} as short as possible.

*Output Capacitance C_O

Output capacitor (C_O) is required for a phase compensation of the internal error amplifier. The capacitance and the equivalent series resistance (ESR) influence stability of the regulator.

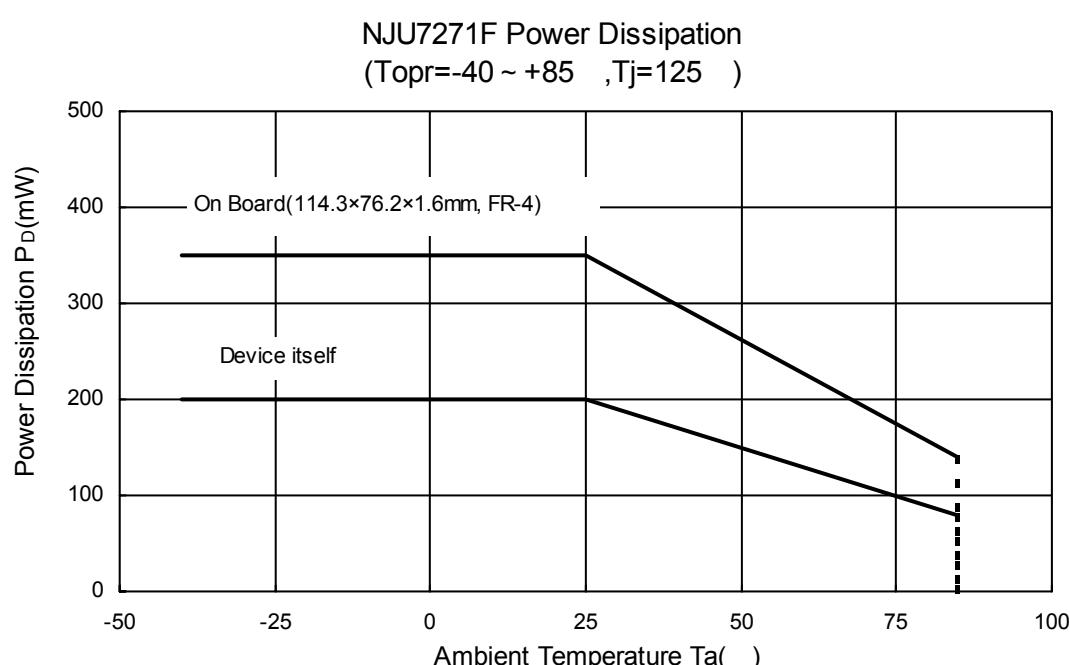

If use a smaller C_O , it may cause excess output noise or oscillation of the regulator due to lack of the phase compensation. Therefore, use C_O with the recommended capacitance or greater value and connect between V_O terminal and GND terminal with minimal wiring.

The recommended capacitance depends on the output voltage. Low voltage regulator requires greater value of the C_O . Thus, check the recommended capacitance for each output voltage.

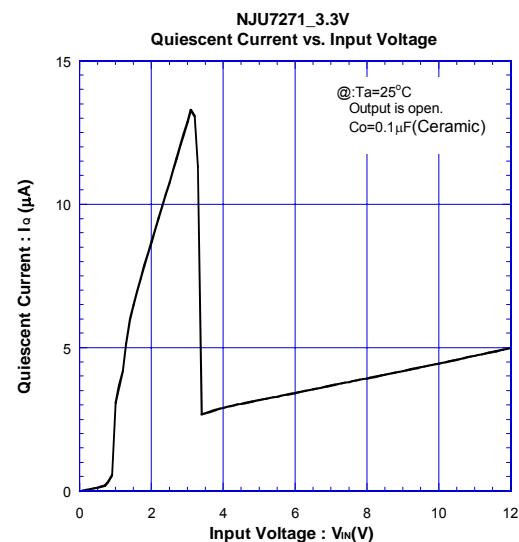

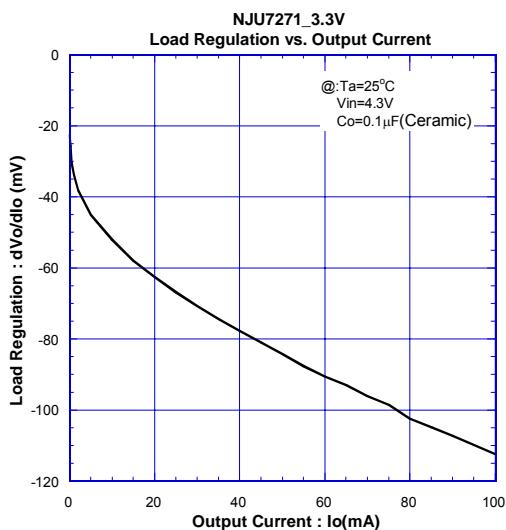

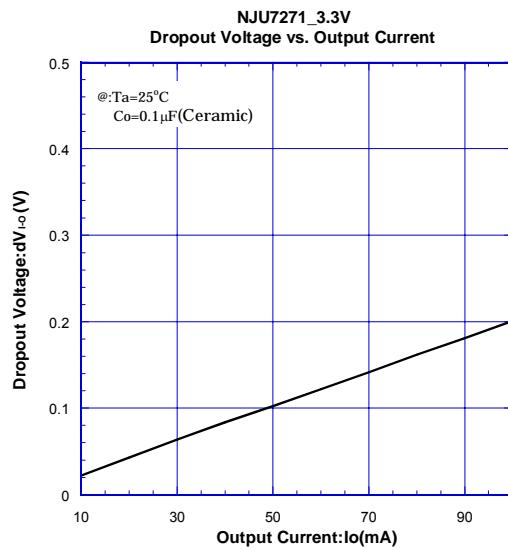

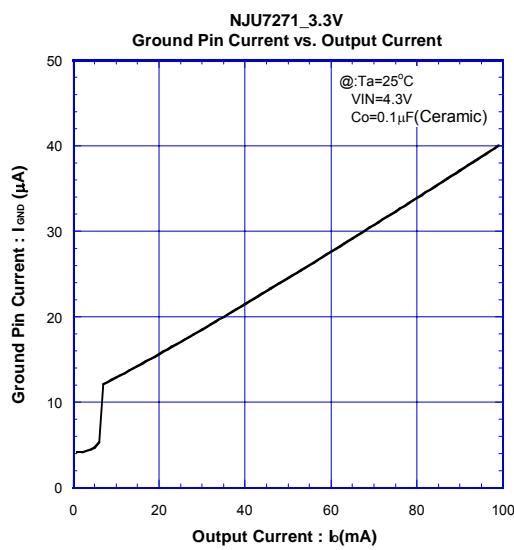

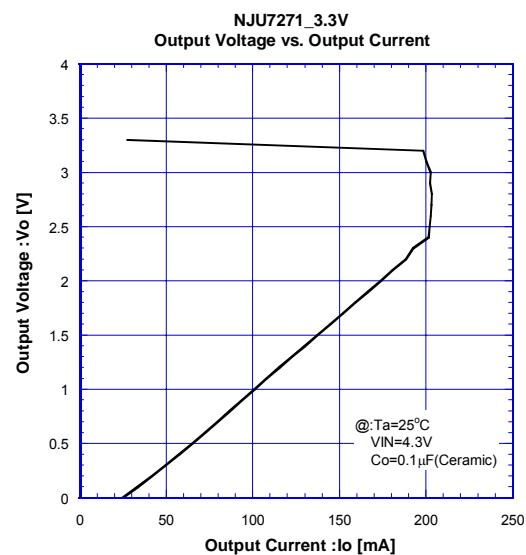

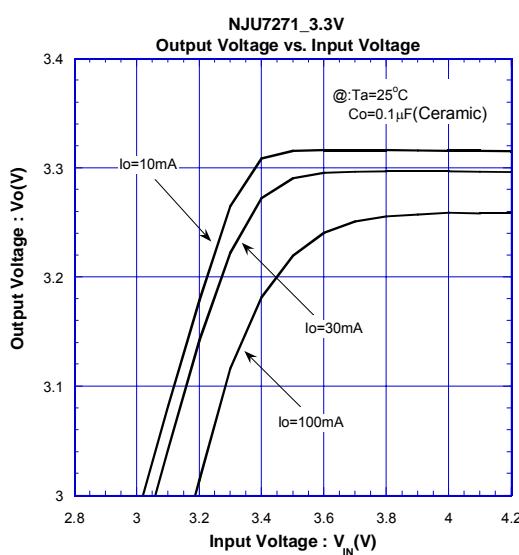

Use of a greater C_O reduces output noise and ripple output, and also improves transient response of the output voltage against rapid load change.

This product is designed to work with any capacitor including a low ESR capacitor for the C_O ; however, refer "Equivalent Series Resistance vs. Output Current" and choose suitable capacitor.
